

NORGES BANK OCCASIONAL PAPERS No. 38

Historical Monetary Statistics for Norway – Part II

Øyvind Eitrheim, Jan T. Klovland and Jan F. Qvigstad (eds.)

Oslo 2007

Preface

In the fall of 2004 Norges Bank published the first volume in its series on Historical Monetary Statistics for Norway reporting the construction of consistent historical time series for a set of key macroeconomic variables for Norway. The aim of the project has been to stimulate research in the area of monetary history, and to foster empirical analysis of long runs of time series data. The first volume covered historical consumer prices, monetary aggregates, bond yields, exchange rates, stock and housing prices, as well as real GDP and main demand components. The time span covered by this book was mainly between 1819–2003. In addition to the voluminous documentation of data, the book also discussed some of the methodological issues involved in constructing historical time series spanning long periods of time, as well as some of the institutional aspects of financial markets in Norway during that period.

With the publication of this volume, Norges Bank completes its project of collecting and systematizing historical data of relevance for price stability and financial stability. The data series presented in this volume are complementary to the historical time series published in the first volume, a fact which is reflected in the name of the second volume. It has been the explicit purpose of the project to enhance the availability and to facilitate the use of historical data for economic research and analysis. Norges Bank has therefore made all data available in a downloadable format at its web-site www.norges-bank.no. The database will also be updated every year. The principles behind the construction of the historical data are outlined in the articles contained in the two volumes of Historical Monetary Statistics for Norway. The users should notice, however, that additional information about updates and revisions of the historical data may be available only on Norges Bank's web-site. We therefore strongly advice users of the historical database to check the update and revision status. Attached to the data there will be records over all main changes since the books were published.

In Chapter 1 Øyvind Eitrheim and Jan T. Klovland present Central Bank interest rates for the entire period of operation of Norges Bank back to 1818 and report time series for the yield of short term government T-bills for periods in the 20th century not previously covered by other studies. They also present interest rates for the embryonic money market from the early 1960s. In Chapters 2 and 3 Jan T. Klovland presents new historical information on the balance sheets of savings banks and commercial banks in the 19th century. On the basis of this information, the historical time series for aggregate money holdings and bank credit aggregates, which were presented in the first volume of the Historical Monetary Statistics project, are revised and extended.

A substantial part of the historical material presented in the two books on historical statistics for Norway would have been impossible to collect had it not been for the unique source of material gathered in the Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices kept at the Norwegian School of Economics and Business Administration in Bergen. Ola H. Grytten outlines the background and origin of the Wedervang Archive in Chapter 4. Grytten made extensive use of this archive in the first volume when he constructed a new consumer price index for the period from 1516 to 1871. In this volume Grytten completes his project on extracting data from the Wedervang Archive. In Chapter 5 he presents historical wage indices organized by occupation for more than 100 different types of employment in the Norwegian labor market from 1726 to 1940. In Chapter 6 data for daily, monthly and annual wages by occupation are aggregated into nominal series for annual wages organized by industry. These are spliced with other series for annual wages to form times series for annual wages between 1726–2006. Finally, in Chapter 7 we provide an informal cross check of the new historical data presented in the other chapters of this volume. First, we present time series for short term and long term real interest rates between 1820–2006 before discussing the size of revisions of the aggregate money holdings and bank credit aggregates. Finally, we compare real aggregate annual wages with GDP per capita for the period 1830–2006.

Norges Bank has followed two main principles in its pursuit to collect and systematize historical monetary statistics. First, we have followed the data in the sense that we have been searching for hitherto unexplored sources of historical data. We were lucky and stumbled upon the Wedervang Archive, which proved to be a rich data source for this project. Second, we decided to engage competent academics to provide the necessary documentation and discussion of methodological issues involved in constructing a historical database.

Finally, we want to thank Leif A. Alendal and Marius Gustavson for valuable research assistance, including the skillful typesetting of various draft versions of the book, proof reading and a final quality control of the historical databases.

Oslo, November 30 2007

CHAPTER 1

Short term interest rates in Norway 1818–2007

Øyvind Eitrheim and Jan T. Klovland^{1,2}

One key area of responsibility of Norges Bank today is to set the interest rate on overnight sight deposits such that the inflation rate will return to the monetary policy target value of 2.5 per cent. The objective of the liquidity policy of the bank is to ensure that the desired interest rate is implemented in the money market. In a historical perspective it has always been an important task for a central bank to provide liquidity to the general public. During the first one and a half century after the birth of Norges Bank in 1816, the main channel for Norges Bank as a liquidity provider was through operations in the discount market. The main interest rate in this market was the discount rate which was set by Norges Bank. In the modern and more sophisticated financial markets which developed during the latter half of the 20th century, a host of instruments are available for the central bank's liquidity policy. This chapter gives an overview over the historical developments of short term interest rates of key importance for the implementation of monetary policy.

¹Øyvind Eitrheim is director of the Research Department of Norges Bank. Jan T. Klovland is professor at the Norwegian School of Economics and Business Administration in Bergen and a special adviser to the Research Department of Norges Bank.

²We are grateful for helpful and stimulating comments from Jannecke Ebbesen, Asbjørn Fidjestøl, Audun Grønn, Gunnvald Grønvik, Morten Jonassen, Jan F. Qvigstad and Anders Svor. We also want to thank Leif A. Alendal and colleagues in the Department for Market Operations and Analysis in Norges Bank for efficient research assistance. The responsibility for remaining errors and omissions rests solely with the authors.

1.1 Introduction

Information on the money market in Norway in the early period is mainly confined to the Central Bank discount market and the market for bank deposits. Short term securities with a maturity of one year or less were not issued until Treasury bills were introduced in May 1941 (see Section 1.4), and even in this case there were no regular market quotations and a well functioning secondary market until the Treasury bill market was reinvigorated in 1985. A rudimentary money market can be traced back to the late 1950s, but it was only in the 1970s that eurokrone,³ interbank and other money market instruments began to be more fully developed. This chapter gives an overview over the different markets which have been of most importance for the implementation of monetary policy since 1818.

Today Norges Bank uses the interest rate on *sight deposits* as its key interest rate for monetary policy. The Executive Board of Norges Bank makes decisions about the sight deposit rate in their interest rate meetings which are held about every six weeks. In order to implement the desired level of interest rate in the short term money market, the bank directs its liquidity policy to ensure that the marginal interest rate on Central Bank liquidity attains a level just above the sight deposit rate. The most important instrument used by the bank today for this purpose is through *F-loans*.⁴ The interest rate on F-loans are in most cases determined by multi-price auctions.

Modern interbank markets offer a host of instruments for the Central Bank to affect the liquidity in the short term money market in order to implement its monetary policy decisions. If we look at the previous two decades, Norges Bank has also used liquidity instruments like *F-deposits*, *foreign currency swaps*, *bank certificates (CDs)*, *T-bills* and *bond repurchase agreements* to fine-tune liquidity.

Historically, however, when Norges Bank started its operations in 1818, it provided short term liquidity through the discount market (see Section 1.2 for details). The discount market was the most important market for short term liquidity throughout the period up to World War II. After World War II, however, the discount rate ceased to function as a market instrument and was rather used to signal the lower end of the structure of administered interest rates.

Section 1.2 contains a description of the discount market in Norway before World War I and discusses Norges Bank's role in this market in the early years after its foundation and the following century. As the markets for deposits in savings banks and commercial banks were developed during the 19th century we also compare the discount rates with bank deposit rates. Section 1.3 compares interest rates in the discount market with bank deposits rates from 1914 onwards. In sections 1.4 and 1.5 we discuss developments in the short term money market and the market for short term government debt (Treasury bills) after World War II. Onshore and offshore money markets in Norwegian

³We use the term eurokrone rate as a general reference to the implicit rate of interest following from a swap operation in the currency market involving Norwegian kroner as one of the currencies. See Section 1.5 for further details.

⁴F-loans are fixed-rate loans with average maturity (January 2006–October 2007) typically less than one week, although some loans can be supplied with longer maturities. Since 1999 F-loans have been fully collateralized against a broad range of securities. See Kran and Øvre (2005) and Fidjestøl (2007) for a broader presentation of Norges Bank's liquidity policy.

kroner became gradually more integrated, in particular during the late 1970s and early 1980s. In the mid 1980s the T-bill market was reinvigorated in an attempt to develop a well functioning second hand market for short term securities. Section 1.6 provides an overview of the development of the marginal interest rate on Central Bank liquidity from the late 1950s onwards. Basically this covers a period where the institutional framework, in which Norges Bank operated, was first changed from a system based on more or less forced “cooperation” between the government and the banks (1950s and early 1960s), to a system of regulations which were codified in the new provisions of the Monetary and Credit Policy Act (late 1960s and 1970s), then to a gradually more deregulated system based on market oriented instruments (late 1970s and 1980s), and finally, to a predominantly market oriented system from 1990.⁵

⁵For more background information about Norwegian monetary policy and financial markets, see e.g. Norges Bank (2004, 1995) for a discussion of the past two decades. For an overview over the Norwegian monetary and credit system in the 1970s and 1980s, see Norges Bank (1989, 1985), extending the presentation in Eide and Holli (1980); Eide (1973).

Norges Bank liquidity instruments - Overview over markets.

1818	Regional discount markets	Norges Bank's branches would offer discount loans to endorsers of bills of exchange. ^a Norges Bank would typically pursue a cautious policy with respect to the solidity of the endorser.
1892	National discount market	The revised Norges Bank Act of 1892 ensures a unified discount loan policy across the different regions.
1941	T-bill market	The government introduced T-bills to withdraw excess liquidity from the banking sector. By the early 1950s T-bills had ceased to play any important role.
1965	Automatic lending facilities	A new Monetary and Credit Policy Act was introduced and an automatic lending facility was introduced for the banks. The lending system was subject to frequent adjustments from 1965 to 1985.
1979	Interbank market via foreign currency swaps and forward agreements,	In order to control bank liquidity Norges Bank entered the foreign exchange market buying and/or selling e.g. USD against kroner in the spot and/or forward market.
1985	T-bill market (reinvigorated)	The market for short term certificates issued by private banks, non-financial corporations or government sectors was reinvigorated. T-bills issued by the central government typically had 3, 6 and 12 months maturity.
1986	D-loans	The automatic lending facility in Norges Bank was revoked in March 1986 and replaced with a simpler system with a lesser degree of automatic lending. From December 1986 the overnight lending rate (D-loan rate) was used actively to stabilize the exchange rate. The D-loan rate was the key administered interest rate set by Norges Bank until the summer 1993.
1987	F-loans	Auction of F-loans with maturity up to 12 months. From 1994 the maturity of F-loans has only exceptionally been more than two weeks.
1991	Interest bearing sight deposits	From January 1991 private banks were offered a non-zero interest rate on their sight deposits in Norges Bank. From 1996 the sight deposit rate has been the key administered interest rate set by Norges Bank.
1992	F-deposits	Auction of F-deposits with maturity up to two weeks.

^aA bill of exchange is a written acknowledgement of the existence of debt, often linked to trade credit.

1.2 The discount rate of Norges Bank and deposit rates in private banks before 1914

A bill (of exchange) is a written acknowledgement of the existence of debt.⁶ Such debt instruments were often linked to trade credit, but the security may also have originated from purely financial transactions. Unless the bill was payable on demand the drawer of the bill had to wait until the bill matured (e.g. after ninety days or at a specific date) to get his money. If the owner of the bill wanted to raise money before this date, the bill might be sold to – which is to say discounted at – a commercial bank, a Central Bank or some other financier specializing in this kind of business. The purchaser of the bill would then charge the seller an amount of money for the period until the bill was due for payment. This amount, expressed as a rate of interest per annum, is referred to as the *discount rate*.

When Norges Bank started its lending activities in October 1818 the intention was that one fourth of the loan portfolio should be reserved for discount loans, the remainder was to be given as mortgage loans.⁷ But even this modest intention failed to materialize as the discount loan share was only about 10 percent until the mid 1830s, as shown in Figure 1.1. In 1838 several attempts were made to increase the volume of discount loans, but progress was slow until 1850. At that time the share had reached 20 per cent, after which the share of discount loans rose steadily and more rapidly than before.

There are several reasons for the rather peculiar composition of the assets of Norges Bank in this period. This issue was fiercely debated among Members of Parliament and businessmen at the time, and it has remained a controversial point in the monetary history of Norway ever since.⁸ The most important factor is probably the lack of other institutions offering mortgage loans in this period. It was not until 1851 that the Norwegian Parliament created Kongeriket Norges Hypotekbank with the sole purpose of providing mortgage loan to the general public, so in the meantime Norges Bank yielded to the pressure of the demand for such loans.⁹ The Central Bank adopted a cautious policy with respect to the solidity and number of the endorsers of the bills, which may have restricted its discounting business. Because loanable funds were allocated to the various branches of the Central Bank at fixed proportions it was often claimed that the Christiania¹⁰ branch was constrained in its discounting due to the lack of funds.¹¹

The Central Bank discount market was limited until the 1850s – the resources of the bank were

⁶See for example King (1936) and Aschehoug (1913) for a general introduction to the nineteenth century discount markets.

⁷Rygg (1918, pp. 164–165, 231–237).

⁸Important contributions include Aschehoug (1913); Rygg (1918); Keilhau (1952) and Sejersted (2002b,a).

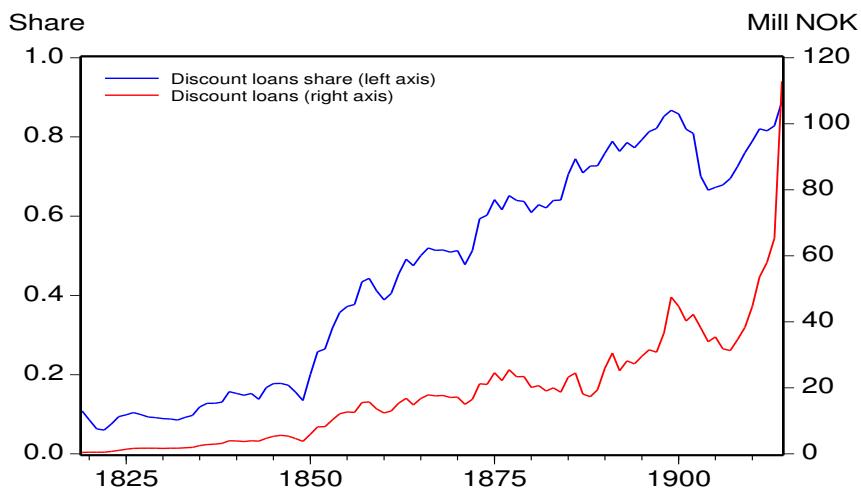

⁹The savings banks were reluctant to offer mortgage loans in this period, preferring instead renewable loans provided with personal endorsements. The usury laws, restricting mortgage loan rates to a maximum of four percent, is a crucial factor in connection with the lack of institutions supplying loans with a fixed collateral.

¹⁰The capital of Norway was named Christiania at the time when the Central Bank was founded in 1816. Its name was written Kristiania from 1877 and changed name back to its original name Oslo in 1925.

¹¹Sejersted (2002b) maintains that this argument was not always valid in the 1840s, when the Christiania branch during some periods actively sought new mortgage loans due to lack of suitable bills for discounting.

small and to a large extent it was preferred to invest in long-term loans backed by collateral rather than short-term bills. Furthermore, the discount loans were mostly in the form of renewable bills (*vekselobligasjon*) rather than two or three-month trade bills.¹²

FIGURE 1.1 The volume of Norges Bank discount loans and their share of total loans 1819–1914

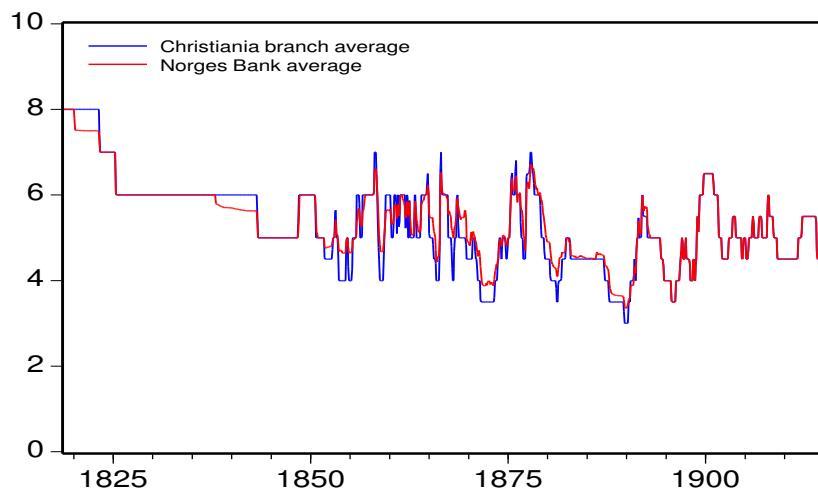

As seen in Figure 1.1, the discount business of Norges Bank expanded significantly from the early 1850s, both in absolute terms and as a share of the total loan portfolio, although the volume of discount loans did not surpass mortgage loans until February 1864. The share of discount loans rose to 87 per cent in the financial boom year of 1899 but fell back to 67 per cent in 1904. The temporary increase in mortgage loans and other types of long-term loans did not primarily reflect a strategy of reverting to mortgage lending; it was largely a consequence of the involvement of Norges Bank in the winding-up process after the banking difficulties in this period.¹³ At the eve of World War I discount loans once again accounted for well over 80 per cent of the total portfolio.

Monthly averages of the discount rate are shown in Figure 1.2 for the period October 1818 to July 1914. The monthly *average* series, which is tabulated in the appendix, differs from the ‘Norges Bank discount rate’, conventionally referred to in most previous work in two respects. First, in months with changes in the discount rate it represents a true monthly average – different rates are weighted

¹²Loans in the form of *vekselobligasjon* were in practice renewable against a payment of typically 10 percent of the loan sum each year, making them long-term loans with a floating interest rate. The basic reason for their widespread use was the usury laws, which did not apply to such bills.

¹³After the Christiania crash in 1899 the property market collapsed and a number of small banks in Christiania experienced liquidity and solvency problems, in most cases leading to failure. Norges Bank assisted in the liquidation process by purchasing assets from the troubled banks, thus temporarily locking up some of its resources in mortgage-backed loans. See Rygg (1954, pp. 248–276) for details.

FIGURE 1.2 Norges Bank Discount Rate, in per cent. Monthly Average. October 1818–July 1914.

Source: Statistiske oversikter (Historical Statistics) 1948, Statistisk Sentralbyrå (Statistics Norway).

by the fraction of the month during which they were in effect.¹⁴ As discussed in more detail below it should be borne in mind that before 1893 each branch of Norges Bank was allowed to fix the level of the discount rate at their own discretion. Conventionally, the discount rate of Norges Bank has been associated with the rate at the Christiania branch in this period, although this rate in general differed from the national average. Although the Christiania branch was the largest with respect to the amount of discount loans, its share of the total discount loan portfolio fell from about 50 per cent in the 1830s to about 30 per cent from the early 1850s. Thereafter it was mostly below this figure, even dipping below 16 per cent in 1888.¹⁵ The new series is considered to be more representative of the national level by weighting the rate set by individual branches by their outstanding loan portfolios at the end of the preceding year. Monthly data on the discount rates set by the various branches and the national average can be found in the appendix. Table 1.A.1 gives the end-of-month data series.

Discount rates at Norges Bank's branches 1818–1892

When the discounting began in October 1818 Norges bank had four branches: Christiania, Bergen, Christianssand and the main office in Trondhjem.¹⁶ The discount rate was set at eight per cent,

¹⁴For example, when the discount rate at the Bergen branch was increased from 5 to 6 per cent on 16 October 1856 (this was the only change during the month), the average is computed by weighting 5 per cent by 15/31 and 6 per cent by 16/31.

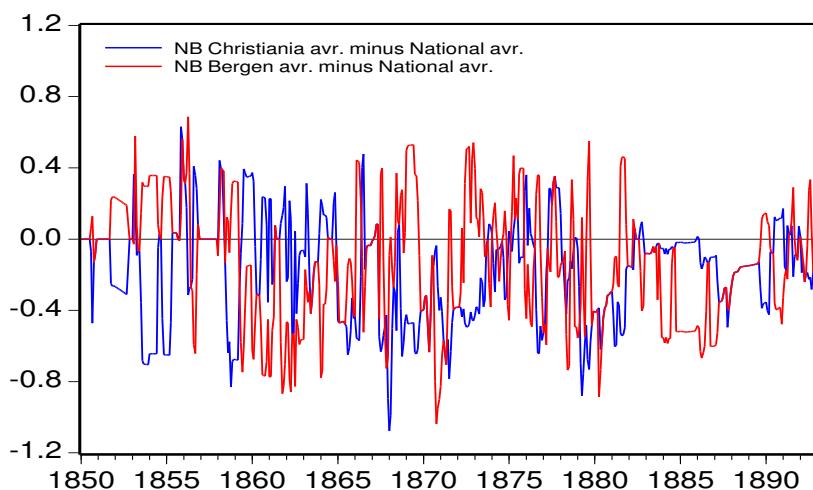

¹⁵At the end of 1848 and 1857 the discount portfolio of the Bergen branch was the largest, in 1872 Trondhjem and in 1888 Skien branch accounted for the largest share of discount loans.

¹⁶Norges Bank was founded in accordance with the Monetary Affairs acts of June 14 1816. The main office was located in Trondhjem until 1897 when it was moved to Oslo (Christiania).

which may have been well below the market rate at the time. At the Christiania branch this rate was maintained until April 1823, but it was reduced to seven per cent in February 1820 at the main office, and most likely also at the Bergen and Christianssand branches.¹⁷ Until about 1850 the rates prevailing at the various branches were changed infrequently. Some differences arose in 1838 when the new branches in Drammen and Skien opened. Bergen, Christianssand and Trondhjem maintained a rate of 5 per cent from January 1838 to May 1843, whereas the other branches kept it at 6 per cent. The different discount rates in this period reflect, at least in part, different liquidity positions at the various branches.

Around 1850 we see the beginning of a more active discount rate policy, both with respect to more frequent changes (cf. Figure 1.2) and more geographical differentiation. Figure 1.3 brings some information on the latter issue by graphing annual averages of the rates prevailing at the Bergen and Christiania branches minus the national average.

FIGURE 1.3 Annual averages of rates prevailing at Norges Bank's Bergen and Christiania branches minus national average rate. 1850–1892. Percentage points

By the 1850s the Board of Norges Bank was well aware of the fact that the level of discount rates set by the branches was affected by their liquidity positions.¹⁸ In the Board's report on the activities of the period 1854 to 1856, it was explained that the reduction in the discount rates at some

¹⁷The information on the discount rates set by the various branches and offices is not wholly complete. The data have been pieced together from information in the Norges Bank archive located at the Norwegian Public Record Office (*Riksarkivet*), various Parliamentary Papers, newspapers and Rygg (1950); see the appendix for further details on sources. The information was somewhat incomplete in the middle of the 1850s and particularly in the early years after a new branch had started its operations.

¹⁸The amount at the disposal of each branch for loan purposes depended on the amount deposited with the branch and some additional funds transferred from the Board at the main office.

branches in 1854, notably at Christiania and Drammen, was due to a surplus of liquid balances at these branches.¹⁹ The Drammen branch kept the rate low in 1855, which resulted in a strong demand for loanable funds which the local branch was unable to satisfy, leading to a request for transfer of more funds. This was declined by the Board, which rather openly indicated in their report that the rate had been set too low.

Figure 1.3 and the data series in the appendix show that some regional differences in discount rates did exist in the nineteenth century, which likely reflect local money market conditions. The discount rate at the Bergen branch was relatively low in the years from 1859 to 1865, the same situation was observed in Christiania between 1865 and 1874, and once again in 1879 to 1881. The average rates in Christiania and Bergen were lower than the national average in every decade except in the case of Bergen in the 1850s.²⁰ It is also evident that periods of local financial distress and possibly mismanagement of the discount business at the local branches contributed to regional differences in interest rates.²¹ The Skien branch held relatively high discount rates from 1887 and saw its share of the loan portfolio increase from about 10 per cent to above 17 per cent in 1888. It was also the last branch to bring the level of the discount rate down to the common national level when such a policy was to take effect when the law governing the activities of the Norges Bank entered into force in 1893.²² Regional variations in interest rates and their relationships to the discount policy of the Norges Bank branches and competition from private banking is an interesting topic that deserves further analysis, but is beyond the scope of the present study.

Bank deposit rates before World War I

The first savings bank (Christiania) was established in 1822 and the first commercial bank (Christiania Kreditkasse) in 1848. Although the commercial banks offered a wider choice of deposit accounts than the savings banks, including demand deposits and time deposits with a fixed maturity, the dominant deposit category was deposits at ‘savings bank terms’ even at commercial banks. Usually the terms formally stated that there was a period of notice of three months before withdrawal of funds could be effectuated. The terms of withdrawal seem to have been practiced in many different ways across banks in the early years, but from the middle of the century a common practice of waiving the three months’ notice seems to have been fairly widespread.

We have monthly data on the rate on deposits on savings bank terms at the Christiania (later Oslo) Sparebank from June 1822, Den norske Creditbank from September 1857 (ending in January 1907) and Christiania Bank og Kreditkasse from November 1876. Until September 1857 the deposit rates at chartered savings banks were stipulated at a maximum of four per cent. In the 1850s some

¹⁹Norwegian Parliamentary Papers (1857), *Dokument no. 10*.

²⁰Discount rates in Christiania were some 15 to 20 basis points lower than the national weighted average in every decade from 1850 to 1892. In Bergen the discount rate was about 5 basis points higher than in Christiania for the whole period of 43 years but lower than in Christiania in two decades, the 1860s and the 1880s (to 1892).

²¹The losses at the various branches of Norges Bank in the 1880s are discussed in detail in Rygg (1954, pp. 169–197).

²²The discount rate at the Skien branch was reduced from 5.5 to 5 per cent on 28 January 1893. After this date the discount rate set by the Board applied to all branches. Even under the new law of 1892 it was technically feasible to have separate discount rates at individual branches, but this was not seen in practice. The issue is briefly discussed in Rygg (1954, p. 106).

savings banks decided to pay higher deposit rates, but could only do so at the expense of forsaking the privileges enjoyed by the chartered banks.²³ From September 1857 it is seen from our data that deposit rates at Christiania Sparebank generally were held at the same level and varied quite closely with those offered by Den norske Creditbank, although some differences did occur. There is much scattered evidence (not systematically sampled here) that the level of deposit rates at savings banks across the whole country could deviate from the rates offered in Christiania. The two commercial banks in the town, Den norske Creditbank and Christiania Bank og Kreditkasse did not succeed in reaching an agreement on a common deposit rate policy until the early 1880s, but any large differences between the rates of two banks did not seem to have been maintained for longer periods except during periods of financial turbulence such as in 1858 and 1859.²⁴

FIGURE 1.4 Difference between the Norges Bank discount rate and average savings deposit rate in Christiania. 1857–1914. Percentage points

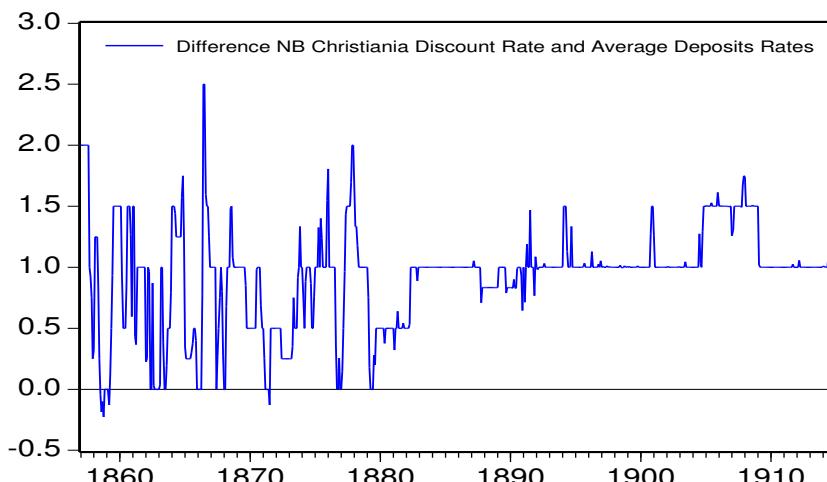

Figure 1.4 graphs the difference between the monthly average discount rate and the average of savings deposit rates in Christiania from 1857 to 1914. A structural change in the relationship seems to have taken place in the early 1880s, which is consistent with the discussion of competition in the commercial bank market in Hertzberg and Rygg (1907, pp. 163–167). Before this, it was evident that changes in the Central Bank's discount rate bore no firm relationship to what happened to deposit rates at savings and commercial banks. Indirectly the same conclusion applies to the relationship

²³The issue is discussed by Egge (1972). The first bank to circumvent the interest regulation on deposits was Akers Sparebank, which was a fast growing and business oriented savings bank under the leadership of Adolf Stabell, one of the founders of Den norske Creditbank in 1857. An excellent introduction to the contemporary debate and practice of deposit rate regulation in the 1850s is contained in Schreiner (1943, pp. 52–73).

²⁴See Hertzberg and Rygg (1907, pp. 163–167).

between the discount rate set by Norges Bank and the discount rate offered by the private banks, although we have no systematic evidence on the latter.²⁵ Although Norges Bank had some influence on the level of rates set by commercial and savings banks, the difference between the Central Bank and the private bank interest rates could vary substantially in the short run. A good example is the financially troubled year of 1866 when the discount rate was increased from 4 to 7 per cent in several steps in May and June, before it was reduced to 6 per cent in early August. Deposit rates, however, gradually edged upwards from July 1866, ending the year at 5 per cent. Delayed response to reductions in discount rates also resulted in deposit rates being higher than the Central Bank discount rate, which happened in several months in 1858 and once in 1859 and 1871.

From May 1882 the difference between the Central Bank discount rate and savings deposit rate remained at around one percentage point for extended periods of time. This observation is important from a monetary policy perspective – it implies that the Central Bank discount rate in this period had a more direct impact than previously on the interest rates set by private banks. Hence, Norges Bank achieved a much higher leverage of its interest rate policy. Between July 1904 and January 1909 the difference was increased to 1.5 percentage points. It appears that the widening of the difference is mainly due to an increased interest rate margin between loan and deposit rates at commercial and savings banks.²⁶

1.3 The discount rates and bank deposit rates 1914–1986

The monthly averages of the Norges Bank discount rate from 1914 until the end of 1986, when it officially ceased to exist,²⁷ are shown in Figure 1.5. It is evident from this figure that there was a marked change in the volatility of the discount rate over time. The discount rate was changed 21 times in the 1920s and 15 times in the 1930s (5 of which were in September and October 1931, when Norway abandoned the gold standard). In the interwar years the discount rate was still essentially functioning in the same way as it had before World War I. Changes in the discount rate had a powerful influence on other short-term rates, but it was in general set at a level consistent with market rates. The discount rate was reduced from 4.5 to 3 per cent in May 1940 and was maintained at that level throughout the war. The huge increases in money market liquidity during the war soon implied that even a historically low level of the discount rate of 3 per cent was not consistent with other interest rates of that time, such as e.g. the interest rate offered on T-bills which were considerably lower, cf. Figure 1.7 in Section 1.4 below.

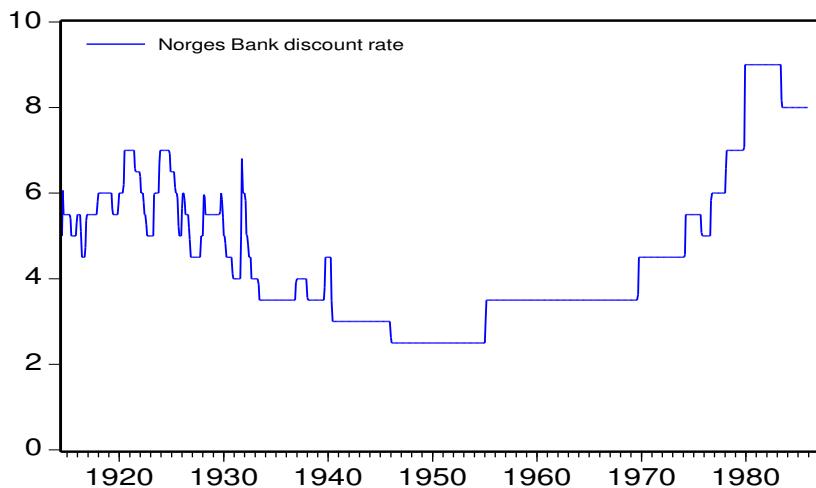

After the war there was only one discount rate change in each decade until 1970. The first one was in January 1946 fixing the level at 2.5 per cent, which was one of the key monetary policy decisions of the postwar government. In the postwar years the discount rate was no longer a market instrument in

²⁵Scattered evidence from the newspaper *Den Norske Handelstidende* in 1865 and 1866 confirms this conclusion.

²⁶See the Annual Commercial Bank Statistics (*NOS Private Aktiebanker*) of 1909, p14*.

²⁷No obituary of the more than 168 year old discount rate seems to have been published at the time – only a short notice in *Penger og Kredit*, no. 1, 1987 to the effect that it had been abolished.

FIGURE 1.5 Norges Bank discount rate, in per cent. Monthly average. 1914–1986.

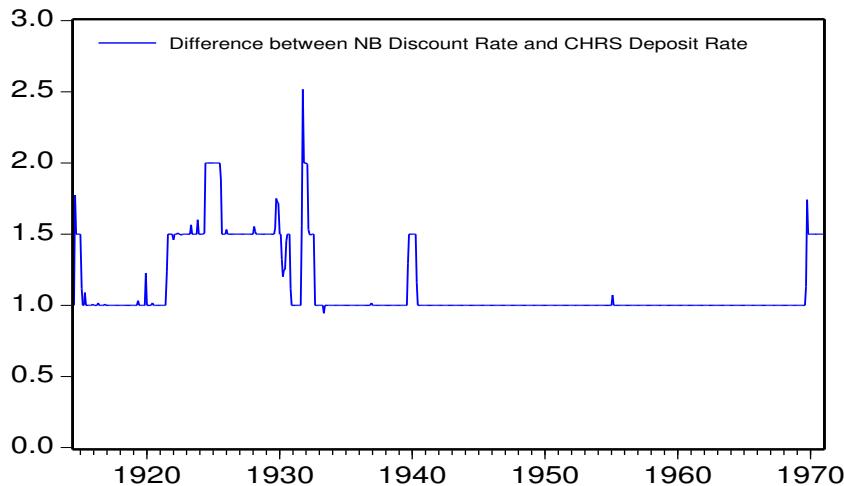

the sense that it generally reflected the market level of short-term rates; rather, it was a key signal rate indicating the lower end of the whole structure of administratively determined interest rates. When the pressure from the rationed demand for credit or interest rate hikes abroad became too strong, the discount rate was increased, usually as part of a larger package of credit restraint. This happened once in the 1950s (February 1955) and once in the late 1960s (September 1969), and several times in the 1970s, when the government was obliged to raise the discount rate to unprecedentedly high levels. From the second half of the 1960s, however, the discount rate came to play a diminished role in monetary policy. The marginal lending rate of the loan facilities of Norges Bank was the key rate affecting interest rates in the emerging money market of the late 1960s (discussed in detail in the next section).

Figure 1.6 shows the difference between the discount rate and savings deposit rate from 1914 to 1970. As illustrated, the difference between the two rates was predominantly 1 percentage point during the bulk of the period. The main exception took place between July 1921 and October 1930, when the difference was 1.5 percentage point or more, reaching a level of 2 percentage points from July 1924 to July 1925. One should view these developments in connection with the severe banking crisis of the 1920s. In addition, there are some short periods when the deposit rate did not follow the discount rate increases. One is from September 1931 to August 1932, a period that comprises both the departure from gold and the renewed concern about banking difficulties following the debt moratorium granted to Bergens Privatbank and Den norske Creditbank in December 1931. The outbreak of war in August 1914 and September 1939 triggered similar situations, both lasting a few months. In general, however, there was a firm link between the discount rate and the bank deposit

rate, implying that the discount rate played a dominant role in affecting other key interest rates in this period.

FIGURE 1.6 Difference between the discount rate and savings deposit rate. 1914–1970. Percentage points

1.4 Treasury bill yields 1941–2007

Interest rates in the primary T-bill market 1941–1985

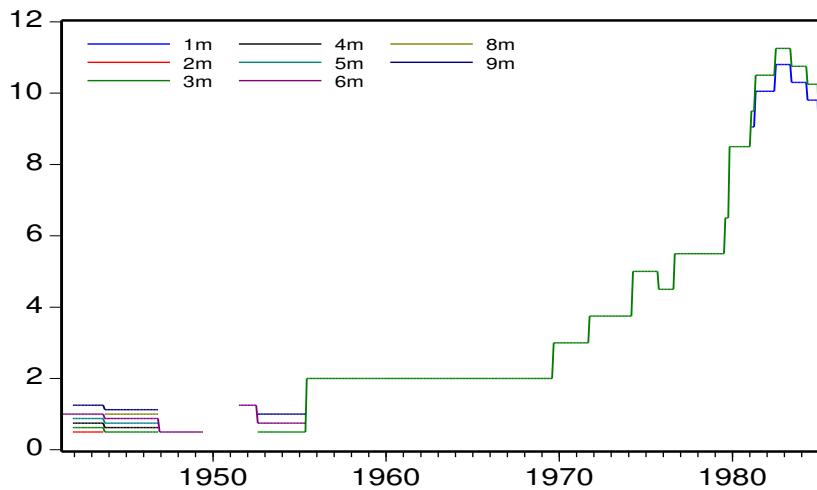

In May 1941 the government introduced Treasury bills as a means to withdraw excess liquidity from commercial and savings banks. The rates of interest at which Treasury bills were offered to commercial and savings banks are shown in Figure 1.7.²⁸ The interest rates are those fixed by the government in the primary market. As the bills were sold on tap in various maturities there was presumably no secondhand interbank market in these securities. The bills could only be bought by private banks in the primary market but it was not illegal for banks to resell them to customers, and to some extent insurance companies and large industrial firms did invest in these securities.²⁹

The bills were initially offered only at a maturity of six months, but the range of maturities was extended several times; from October 1943 there were eight different maturities ranging from 3 to 24 months. The bills could be rediscounted at Norges Bank and were thus highly liquid instruments. Although the terms at which they were initially offered, i.e. one per cent interest rate for the 6 month

²⁸The Treasury bill market during the war is described on pp. 66–69 in the official report on the activities of the Norges Bank during the war 1940–1945 (*Norges Bank under okkupasjonen, Oslo, 1945*).

²⁹There are no data on the amounts resold.

FIGURE 1.7 Interest rates on Treasury bills 1941–1985, in per cent

bill (reduced to 7/8 per cent in October 1943), were not considered attractive by the banks, the bills soon found a ready market. In addition to long-term government bonds they were in fact the only interest yielding investment of any size that the banks had in this period. The outstanding volume increased from NOK million 594 at the end of 1941 to NOK million 3951 at the end of 1945, which at this time represented 41.6 per cent of the total assets of commercial and savings banks.³⁰

The volume of Treasury bills was gradually diminished thereafter as a consequence of the reduction of the excess liquidity of the banks. At the end of December 1949 the amount outstanding had fallen to NOK million 380. By the early 1950s the Treasury bills had ceased to play any important role, but they continued to be on offer to the banks in the following decades, primarily used by banks to smooth seasonal fluctuations in bank liquidity. From February 1955 the interest rates on the Treasury bills was fixed at one half per cent below the discount rate until the early 1970s when there was some more variation relative to the discount rate. The Treasury bill interest rate series is primarily of importance during the 1940s, when it reflects the extreme liquidity of the money market. Together with the short end of the bond market, where we have market based yields on bonds with a maturity down to two years from the second-hand market,³¹ the Treasury bill rates present a more representative picture of the interest rates prevailing in the money market than the discount rate in this period.

³⁰See for example the *Annual Report of the Norges Bank 1949* p. 32.

³¹See Klovland (2004) for data on bond yields.

Interest rates in the secondary T-bill market 1985–2007

In January 1985 a new type of Treasury bill was launched with a view to creating a market for short-term government securities. Bills with maturities of 3 and 12 months were issued according to a regular time schedule to ensure that there always were issues with various maturities in the market. The bills were quoted on the Oslo Stock Exchange. In contrast to previous practice Norges Bank now actively encouraged trade in the second-hand market by acting as a market maker.³²

In the first years from 1985 onwards the volume of transactions was relatively modest. There are many reasons for this, the most important was perhaps that the banking sector was in an extreme liquidity squeeze in these years, borrowing heavily from Norges Bank. The coupon rates were fixed by the Ministry of Finance and these were probably not sufficiently attractive to other investors outside the banking sector.

In 1992 there was an increase in the transaction volume in the Treasury bill market which gained further momentum in 1993.³³ The private banks now moved towards a more balanced liquidity position, which led to more interest in these securities from the banks' side. From June 1993 the bills were sold in the primary market by multi-price auctions, which resulted in a closer alignment of yields in the primary and secondary markets. From October 2000 the bills were made zero-coupon instruments and sold in the primary market by single-price auctions.³⁴

There are several methods that can be used to estimate the term structure of interest rates which also applies for T-bills with maturities between 3 and 12 months. A widely used technique is to estimate spot yield curves (as well as forward rates) by econometric methods.³⁵ We decided to use a simplified version of the Nelson-Siegel model suggested by Svensson (1995).³⁶

The estimated yield series are reported for maturities 3, 6, 9 and 12 months in Table 1.B.2 in the appendix. We often denote this as synthetic yield series since they are based on model estimates which are calculated on the basis of the available T-bill observations in the market. The exact maturities for the market observations may deviate from the reported maturities of the synthetic series.³⁷

In this study we have used observations of the coupon, yield and remaining maturity for all T-bill loans traded on the Oslo Stock Exchange on the last trading day in every month since March 1985 to estimate the parameters in the restricted Nelson-Siegel model.

Admittedly, the available information from market observations of T-bills is quite limited since

³²Further details are given in *Annual Report of the Norges Bank 1985*, pp. 15–19.

³³*Annual Report of the Norges Bank 1993*, pp. 34–35.

³⁴See Jacobsen (2005) for a discussion.

³⁵See for example Anderson et al. (1996) for a general overview.

³⁶The regression format is a simplified version of the Nelson-Siegel model adopted by Svensson (1995). Let R be the yield and m the associated maturity. The yield equation can be written as

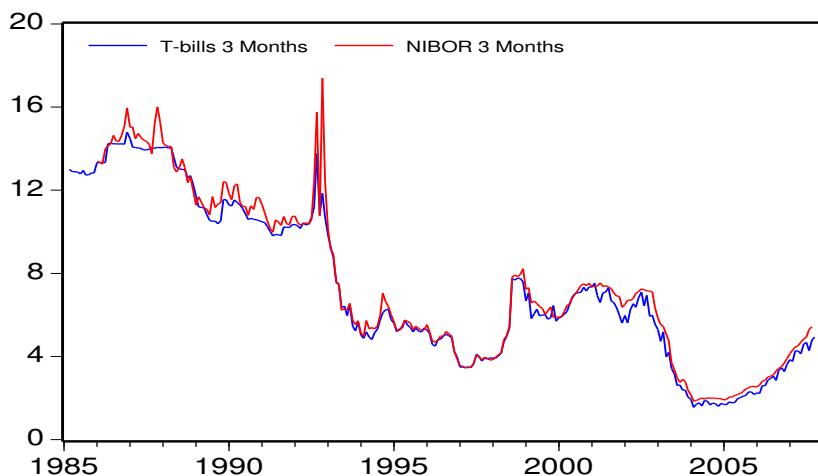

$$R = \beta_0 + \beta_1 \cdot \left[\frac{1 - \exp(-\frac{m}{\tau})}{\frac{m}{\tau}} \right] + \beta_2 \cdot \left[\frac{1 - \exp(-\frac{m}{\tau})}{\frac{m}{\tau}} - \exp(-\frac{m}{\tau}) \right],$$

where we have imposed the restriction $\beta_2=0$ during estimation due to limitations in data availability. The remaining parameters are estimated by a maximum likelihood procedure.

³⁷Norges Bank has published similar synthetic yield series for T-bills with maturities 3, 6, 9 and 12 months since January 2003. The two sets of time series may differ somewhat since they are based on different estimation procedures.

we typically find that only three to five loans are traded. In 1986 up to ten T-bill loans were traded simultaneously and in 1993 there were six or seven loans. Since around 1996 the T-bill loans have typically been issued on the IMM-dates³⁸ in order to smooth liquidity fluctuations. In addition T-bills have been issued in some periods to match main dates for tax payments. There is, however, in some periods, a problem with limited liquidity in the T-bill market. In particular, because of the limited activity in the Treasury bill market before 1993, some caution should be exercised with respect to considering the estimated yield as a sharply determined indicator of the yield of short-term government paper in this period.

FIGURE 1.8 Three months Treasury bill yields and three month NIBOR rate, March 1985– October 2007, in per cent

1.5 Money market interest rates 1959–2007

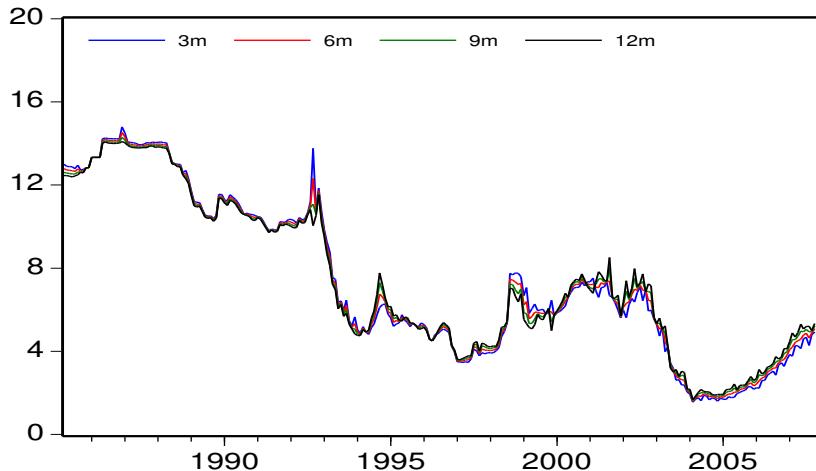

From the early 1980s, time series of the key money market rates of interest, NIBOR in particular, can already be found in publicly available sources.³⁹ A collection of these rates can be found in Tables 1.C.1 and 1.C.2 of the appendix.

The challenge, however, is to extend the eurokrone interest rate data backwards in time to cover the years before the 1980s and to present a broader set of money market rates. Because the offshore eurokrone market was not so well integrated with the onshore domestic money market at the time it

³⁸International Money Market dates are defined by the third Wednesday of the months March, June, September and December.

³⁹The Norwegian InterBank Offered Rate (NIBOR) is quoted as the (loan) interest rate in the (swap) eurokrone market. A monthly series of the 3 month NIBOR rate is available on the homepage of the Norges Bank (http://www.norgesbank.no/stat/renter/pmarked/renter_mnd.xls).

FIGURE 1.9 Treasury bill yields March 1985–October 2007, in per cent

is important to include the latter category as well.⁴⁰ From a variety of sources, most of which are previously unpublished, we have been able to extend some of the key time series back to cover the 1960s and the 1970s, with the data on the 3 month eurokrone rate starting in May 1959. These time series are found in Table 1.C.1 of the appendix.

We use the term eurokrone rate as a general reference to the implicit rate of interest following from a swap operation in the currency market involving Norwegian kroner as one of the currencies.⁴¹ NIBOR is more specifically referred to as the loan rate in the (swap) eurokrone market, NIBID is the deposit rate.⁴² The eurokrone rate i_m^{NOK} has been computed from data on the spot exchange rate against the US dollar S , the forward exchange rate against US dollar F , and the eurodollar interest rate i_m^{USD}

$$i_m^{NOK} = i_m^{USD} + \left(\frac{12}{m} \right) \cdot \left[\frac{F_d - S}{S} \right] \cdot \left(1 + \frac{m}{12} \cdot i_m^{USD} \right)$$

where the subscript m denotes the number of months of the contract period. In this period our series of the eurokrone rate is based on the average of bid and ask rates of exchange and on the average of loan and deposit eurodollar rates of interest at the end of the month, thus being in principle an average of the NIBOR and NIBID rate.⁴³ Note that the data for the period after 1985 in Table 1.C.2

⁴⁰For a discussion of the onshore/offshore terminology in the eurocurrency market, see Levich (2001, pp. 297–298).

⁴¹In practice the other currency of the swap is often US dollars, but in principle (disregarding transaction costs) the eurokrone rate can be derived from currency swaps between NOK and any other major currency.

⁴²The NIBOR rate represents the interest cost a borrower with access to the eurocurrency market would have to pay for borrowing NOK for a specific period of time by means of a currency swap. For a general introduction to the eurocurrency market see for example Allen (1997). An overview of eurokrone market and other money market rates in Norway can be found in Langbraaten and Thorstad (1998).

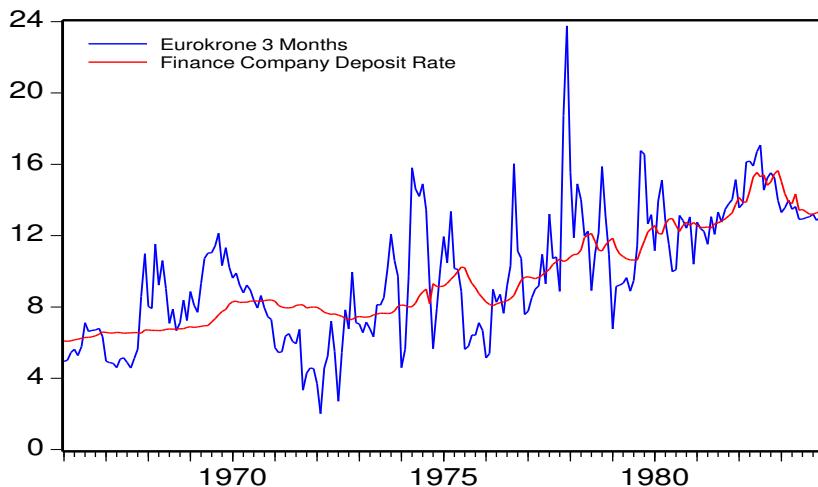

⁴³In the case of NIBOR rates the loan rate of eurodollar interest rate would be inserted in the above formula rather than the

are NIBOR rates, which are at a slightly higher level.

The quality of the eurokrone rate series before July 1972 is somewhat uncertain, and too much significance should not be attached to individual quotations. Nevertheless it is believed that the eurokrone data series present reasonably correct estimates of the course of market rates. Data referring to the two exchange rates involved had to be spliced from various sources, sometimes indicating slight differences in the level of the exchange rates, which creates some uncertainty. All data are in principle end-of-month data, but during certain periods eurodollar interest rates, on the one hand, and spot and forward exchange rates, on the other hand, originate from different sources, which may have created a time difference between the observations. In a volatile market situation, particularly in the currency markets, this is another noise factor.⁴⁴

Tables 1.C.1 and 1.C.2 also include three domestic money market rates, the most important of which are the deposit rates offered by finance companies and the overnight interbank rate.⁴⁵ A series representing deposit rates paid by finance companies is available between January 1966 and December 1983. This interest rate series originates from transactions solely in Norwegian kroner in the domestic money market and comprises a wider set of investors than the large banks involved in the eurocurrency market. The precise maturities of the deposits are not known, and may vary somewhat over time, but the information we have indicates that it largely concerns short-term time deposits up to three months maturity.

FIGURE 1.10 The finance company deposit rate and the three months eurokrone rate, in per cent. 1966–1983.

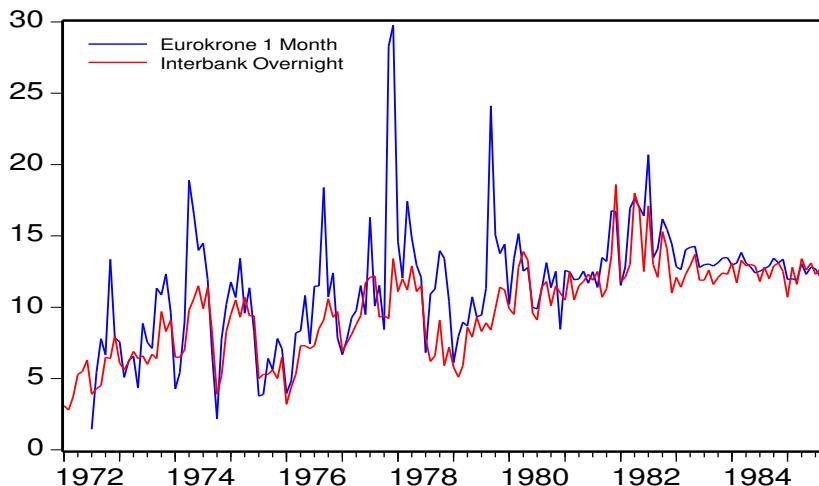

middle rates used here, and the ask rate in the forward market and bid rate in the spot currency markets would be used.

⁴⁴Closing rates of the last working day of the month have been used whenever possible.

⁴⁵Table 1.C.1 also includes a short series showing the rate of interest offered by banks to customers on deposits referred to as so-called ‘special terms deposits’, i.e. large deposits whose terms are determined after negotiations in each case.

The finance company deposit rate is shown in Figure 1.10 together with the three month eurokrone rate. These two interest rates represent different segments of the money market rate – the eurokrone rate is indicative of the offshore market involving large banks participating in the eurocurrency markets, the finance company deposit rate represents the onshore market.⁴⁶ How well integrated these two segments of the money market were is an important issue in this connection. Our hunch is that they were not well integrated in the middle of the 1960s when the first comparison can be made but that the degree of market integration grew over time. As seen in the figure the domestic rate is much smoother than the eurokrone rate in this period. Nevertheless, it is quite evident that there is some interdependence between the two series. Recurrent periods of turbulence in the currency markets cause some excess volatility in the eurokrone rate in the 1970s but by the early 1980s it appears that there is a fairly strong convergence between the two rates. However, it should be borne in mind that the deposit rate reflects transactions between financial intermediaries and customers while the eurokrone rate is an interbank rate, which may imply that Figure 1.10 is not an ideal basis for a comparison of the offshore-onshore differential.

FIGURE 1.11 One month eurokrone rate and overnight interbank rate, in per cent. January 1972–August 1985

Another comparison can be drawn from an inspection of Figure 1.11 showing the one month eurokrone rate and the overnight interbank rate. The latter series is also a pure domestic krone rate of interest determined in the daily ‘telephone’ market between domestic banks. In the domestic interbank market all banks could participate, including the small commercial banks and the large number of savings banks that were excluded from the euromarket. Once again the eurokrone rate

⁴⁶The term ‘offshore’ is misleading in the sense that the currency swaps involving transactions in Norwegian kroner may be performed by two domestic banks located within the country.

is more volatile than the domestic interbank rate, even if the latter is an overnight rate that typically should tend to be more volatile than one month rates in general. The excess volatility of the eurokrone rate is mostly occurring in periods of unrest in the currency markets and expectations of exchange rate realignments, as in the autumn of 1977.⁴⁷ A reform in 1978 had important consequences for the banks' ability to manage their liquidity via the FX market. After the introduction of the zero-position regulation, requiring banks to balance their net spot and forward position at the end of each month, those banks who were authorized to deal in foreign currency, could use currency swaps more actively than previously to manage their liquidity. The swap market soon developed into one of the most largest and most liquid parts of the money market. Since 1979 Norges Bank has used swap transactions as an additional instrument in controlling liquidity.⁴⁸

We see from Figure 1.11 that from the late 1970s there is a quite marked tendency towards convergence between the two rates, which is quite firm evidence to the effect that the various segments of the Norwegian money market had become more integrated by that time. The correlation between the two series is also quite high.

1.6 Norges Bank interest rates 1955–2007

This section gives an overview over interest rates which are administered directly by Norges Bank, like the discount rate discussed in section 1.2 above and the sight deposit rate which is today's key administered interest rate. We also include interest rates which are indirectly affected by the use of Norges Bank's liquidity instruments. The system through which Norges Bank has affected bank liquidity has been subject to large changes in this period, basically from a system based on direct and indirect regulatory instruments⁴⁹ to a system which is based on market oriented instruments. We describe the evolution of the Norges Bank lending facility and some of its interactions with reserve requirements and direct regulations of bank lending in some detail in the following sections. For the entire period 1955–2007 we have made an attempt to estimate the interest rate on marginal liquidity from Norges Bank, denoted as *marginal CB-liquidity* or the *marginal liquidity rate*. The principle behind the construction of this series will be discussed in the following sections and the precise definition is given in section 1.8. Before we discuss the evolution of the system of liquidity regulation since 1965 it may be useful to provide a bird's eye perspective on the development of the main interest rates affected directly or indirectly by Norges Bank over this period.

⁴⁷The high eurokrone rates in the autumn of 1979 may be a spillover from fluctuations in the value of the US dollar and interest rate increases in the United States. Thin forward markets in Norwegian kroner and structural changes in this market due to an increased level of oil taxes affecting the hedging demand by oil companies may also have contributed in this period.

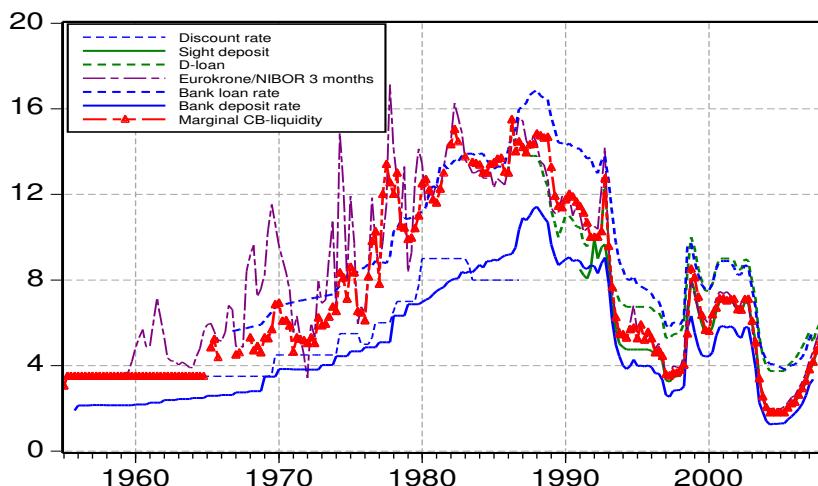

⁴⁸See Norges Bank (1989, Chapter 4) for a discussion of the Norwegian money market in the late 1970 and early 1980s.

⁴⁹In addition to the direct and indirect instruments which were available under the Monetary and Credit Policy Act of 1965, there were also several important changes in the Norges Bank lending facility during this period. This regime was gradually deregulated during the 1980s, see Grønvik (1994) for a discussion.

1.6.1 A bird's eye perspective on Norges Bank interest rates 1955–2007

The data are mainly recorded from various vintages of Norges Bank Quarterly Bulletin (*Penger og Kreditt*) and annual reports. For some periods we have supplemented the previously published data with additional information based on our own calculations. Figure 1.12 shows the development of the interest rate on marginal Central Bank liquidity from 1955 to 2007 (quarterly average). The interest rate on marginal CB-liquidity is combined from several different series which will be explained in the following sections.⁵⁰ In the period 1955–1965 the marginal liquidity rate is given by the Norges Bank discount rate. The new Norges Bank lending facility introduced in 1965, was an automatic lending system where loans to individual banks were divided into tranches at rising interest rates. The marginal liquidity rate soon increased to a level well above the discount rate.⁵¹ Some main observations about the developments in interest rates over the period 1955–2007 are noted below.

FIGURE 1.12 Norges Bank interest rates 1955–2007. The interest rate on marginal CB-liquidity is plotted against the interest rates on D-loans, sight deposits, money market interest rates and bank interest rates on deposits and loans. Quarterly averages, in per cent.

First, whereas the discount rate reaches its peak level around 1980-82 at 9 per cent we see that the marginal liquidity rate diverges from the discount rate and increases to a level around 15 per cent in 1982.

Second, we see that whereas the rate on marginal liquidity mainly stays within a corridor defined by the average interest rate on bank loans and bank deposits during the period 1965–1975, this is no

⁵⁰The data are documented in Tables 1.D.1–1.D.3 in the appendix.

⁵¹The discount rate becomes gradually less relevant as a monetary policy variable and its only role in the following years is that it establishes the lowest interest rate in the Central Bank lending facility.

longer the case for the period 1975–1986. In this time interval the marginal liquidity rate is frequently outside this corridor during periods when the short term money market interest rates are driven up by distress in the foreign exchange market. As these periods were quite frequent during the mid and late 1970s and early 1980s, money market rates (e.g. the 3 months Eurokrone interest rate), were quite volatile. Figure 1.12 illustrates that the rate of marginal liquidity shows similar volatility in this period. During the period 1965–1985 we have estimated the marginal liquidity rate on the basis of data for the *average* and *marginal* interest rate for banks' loans in Norges Bank and the yield on the market paper which Norges Bank issued during the period 1977–1985 as a market oriented liquidity instrument.⁵² After the automatic lending facility was revoked in March 1986 we have set the marginal liquidity rate equal to the D-loan rate. For a precise definition of the marginal liquidity rate in the rest of the period we refer to Section 1.8.

Third, we see that there is a significant change in the location of the marginal liquidity rate within this corridor from 1987 onwards. In comparison with the average interest rates on bank loans and bank deposits we see that both the interest rates on marginal CB-liquidity as well as the interest rate in the interbank market (the 3 months NIBOR) are located closer to the middle of the implicit interest rate corridor which defines the banks' interest rate margin.⁵³

Fourth, from January 1 1987 the Norges Bank discount rate was discontinued more than 188 years after its introduction in October 1818. The D-loan rate established the floor for the marginal liquidity rate until December 10 1992 when the krone was floated after excessive distress in the foreign exchange market during that fall. Interest bearing sight deposits were introduced from January 1 1991 but played no role until the banks' liquidity situation changed from a net borrowing position to a net deposit position in 1993. From 1987 Norges Bank introduced F-loans as an additional liquidity instrument. The interest rates on F-loans were mainly determined in auctions but there were a couple of exceptions when the interest rates on F-loans were set by Norges Bank directly.

Fifth, during the years 1993–1996 the interest rate on marginal liquidity fluctuated within the corridor defined by the administered interest rates on sight deposits and D-loans. From January 1993 the width of this corridor was 1 percentage point (100 basis points), and this width was gradually increased to 2 percentage points from August 1993 to promote improved functioning of the interbank market. Recently, in March 2007, the width of the corridor was decreased to 1 percentage point.⁵⁴ Between late 1993 and late 1996 the administered interest rates were subject to very few changes. F-deposits were introduced in 1992 as an additional liquidity instrument which was managed in a way similar to that of F-loans, i.e. with auctions initiated by Norges Bank. The marginal liquidity rate, however, as measured by the maximum of the interest rate on F-loans and F-deposits, showed significant fluctuations within the corridor spanned by the D-loan rate and the sight deposit rate during this period.

Sixth, from 1996 onwards the main changes in the interest rate on marginal liquidity have been

⁵²End-of month-observations of these interest rates are reported in Tables 1.D.1-1.D.2 in the appendix.

⁵³More details and analysis of the banks' behavior in this period is offered in Grønvik (1994).

⁵⁴A corridor of one percentage point is considered to be wide enough to secure efficient redistribution of liquidity in the interbank market, and this is also more in line with international practice.

initiated by changes in the administered interest rates on D-Loans and sight deposits, rather than by liquidity operations. The marginal liquidity rate has in this period remained quite close to the sight deposit rate.

Finally, whereas the interest rate margin for private banks was entirely made at the cost of depositors in the early and mid 1980s the interest rate margin has gradually shifted towards contribution from borrowers. There has been a downward shift in the interest rate margin on the average deposit rate and an increase in the corresponding margin on the average bank loan rate.

1.6.2 Liquidity instruments 1965–1986

In order to smooth seasonal fluctuations in bank liquidity, new regulations were introduced on April 1 1965. A new automatic lending facility (A-Loans) was introduced which gave the banks access to short-run liquidity from Norges Bank against securities as collateral. Bonds issued or guaranteed by the government could be used as collateral up to 95 per cent of their face value, although not exceeding their market value.

The lending facility was divided into tranches according to a rising interest rate schedule. Loans in the first tranche were charged with an interest rate equal to the discount rate. For the next tranches the bank was charged an additional 1.5 percentage point per tranche. For a bank which needed to extend its loans into the fifth tranche, the marginal interest rate was the discount rate + 6 percentage points. On top of this increasing marginal cost schedule, banks with special requirements could obtain so-called S-loans on terms to be decided separately. As this lending scheme evolved over time, adjustments were made as to how much each bank could borrow within each tranche as well as how many tranches were in use. We have explained the main structure of the new lending facility in the box below.

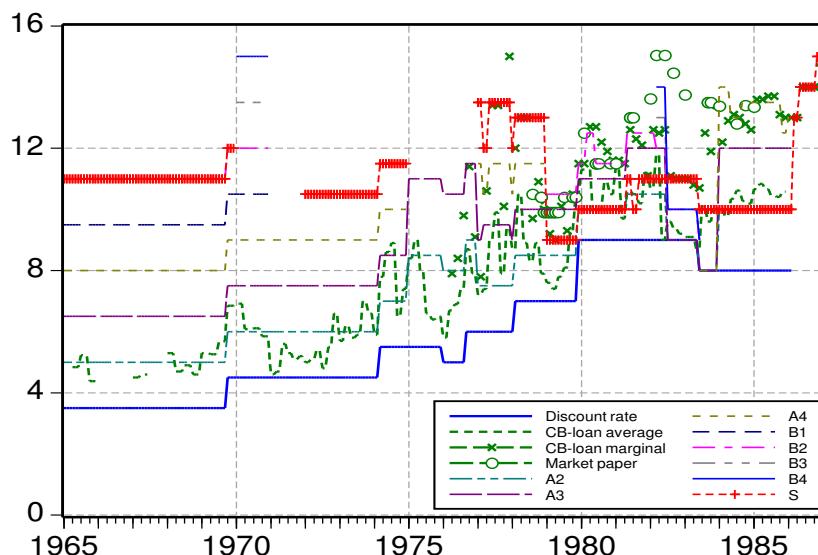

It turned out that the banks made extensive use of this lending facility, and utilized the facility over and above the level of the intended seasonal smoothing of liquidity. The regulations were therefore adjusted from January 1 1971. There were still five lending categories, each of which scaled by limits set as fractions of the banks balance sheet (measured as quotas for two-month periods), i.e. 5, 6, 9, 7 and 7 per cent respectively. The loans had to be held for a seven day period. The interest rate schedule was set as before. For the first tranche the interest rate was equal to the discount rate and then an additional 1.5 percentage point was added for each additional tranche.

Structure and major changes in the Norges Bank lending facilities 1965–1986

April 1965	Automatic loans in five tranches	Automatic loans were introduced to smooth fluctuations in bank liquidity.
January 1971	Truncated loan quotas (five tranches)	The banks made extensive use of the lending facility over and above the level justified by seasonal smoothing of liquidity. The quotas for two months lending were truncated.
January 1975	A-loan system with three tranches, no collateral	The term A-Loans was introduced. Fewer tranches with same capacity but increased interest rates implied a tightening of credit.
January 1977	Five tranches were reintroduced	Same interest rate structure as previous five-tranche system starting at the discount rate and adding 1.5 percentage point for each tranche.
April 1977	Steeper interest rate schedule	Increases in tranches 3-5 to the discount rate plus 3.5, 5.5 and 7.5 per cent respectively.
December 1978	Market paper arrangement	After a trial period from March 1 1977 the market paper arrangement was made permanent.
January 1979	Introduction of B-loans	The lending facility was split into one automatic part (A-loans) and one conditional part (B-loans). Direct lending control of banks in B-loan position.
1979-1981	Periods of suspension and truncation	In order to control banks' lending growth the monetary authorities tried to force banks into B-loan position.
May 1981	Increased interest rates	Direct regulations (§8 in the Monetary and) Credit Policy Act were introduced and interest rates increased.
1982–1983	Periods of suspension and truncation	A three tranche B-loan system was introduced. The same interest rates were introduced for all A-loans and B-loans (9 and 10 per cent resp.).
July 1983	B-loans suspended	The entire B-loan facility was suspended and replaced with a fourth A-loan tranche.
March 1986	Automatic lending system is revoked	A simpler system for Central Bank lending is introduced with a lesser degree of automatic lending.

In 1975 the rules were changed again. Instead of having five tranches of equal magnitude, the revised system consisted of three tranches of unequal size which added up to the same total lending capacity as the three first of the previous tranches. This represented a tighter lending facility than before. The interest rate for the first tranche was still equal to the discount rate and for the second and third tranche the bank was charged an additional 3 and 5.5 percentage points. The three-tranche system was dubbed the A-loan system and there was no required collateral for this lending facility. Figure 1.13 below shows the main structure of the Norges Bank lending facilities in the period from 1965 to 1986.

FIGURE 1.13 Interest rates in the Norges Bank lending facilities, in per cent 1965–1986.

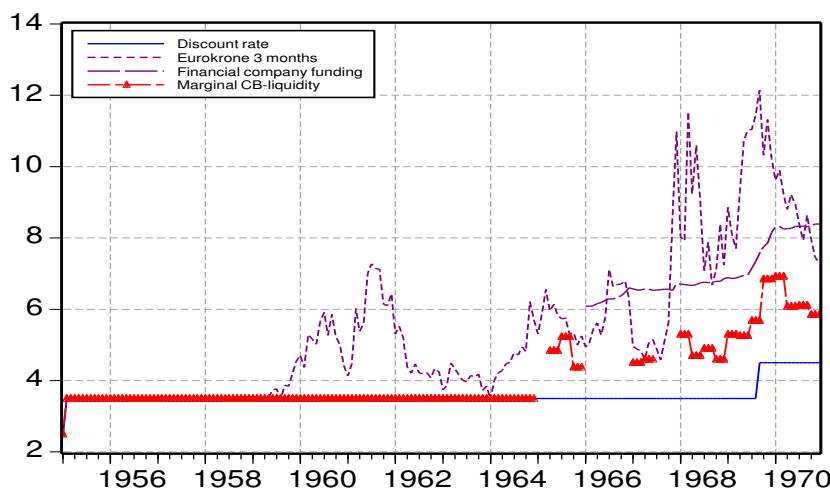

1.6.3 Norges Bank interest rates 1955–1970

The marginal rate of liquidity in the early years is given by the discount rate. From 1965 we have used the average interest rate on Central Bank loans. In Figure 1.14 we have also compared these interest rates with the three months Eurokrone rate and the finance company deposit rate reported in section 1.5. In the period 1965–1967 we see that the money market interest rate corresponds quite well with the estimated interest rate on marginal Central Bank liquidity. In 1968–1970, however, we see that our estimate of the marginal liquidity rate is considerably lower than the 3 months Eurokrone rate and the finance company rate. We have not been able to find data on the marginal interest rate for the banks' Central Bank loans before 1976. From February 1976 the marginal interest rate for each two-

months lending period were reported in Norges Bank's Quarterly Bulletin (*Penger og Kreditt*). We conclude that our estimate of the marginal liquidity rate may be on the low side during 1955–1970.

FIGURE 1.14 Norges Bank interest rates 1955–1970. The interest rate on marginal CB-liquidity is plotted against the 3 months Eurokrone rate and the funding rate of finance companies, in per cent.

1.6.4 The instruments in the new Monetary and Credit Policy Act of 1965

The new Monetary and Credit Policy Act of 1965 introduced a wide range of policy instruments in order to attain credit policy targets given by the central government. The banks were subject to primary reserve requirements and were required to hold a fraction of their portfolio in (low yield) T-bills or government bonds. In some periods the banks were also subject to direct regulation of lending. If their loans had grown above some predefined limit, the banks had to place an amount proportional to their excess lending in non-interest bearing Central Bank deposits (supplementary reserves).⁵⁵ In the 1960s and 1970s the banks' reserve requirements were used in order to attain a money market interest rate level corresponding to the prevailing interest rate norm. This meant a close interaction between the reserve requirements and the increasing interest rate schedule of the Central Bank lending facility. Table 1.1 shows how the different regulatory instruments were used in the years from 1966 to 1988.

⁵⁵The coefficient of proportionality was set to 1 in most years but in 1986-1987 this coefficient was replaced by an increasing schedule which penalized major excess lending more than minor excess lending.

The Monetary and Credit Policy Act of 1965 allowed for several types of direct and indirect regulations of the credit market. In addition there were interest rate regulations in the form of interest rate norms or interest rate declarations. The conditions for B-loans in the Central Bank were also a form of direct regulation of bank lending. In some periods interest rates were also subject to direct price controls.

A lending facility with five tranches was reintroduced in January 1977. For the period January–April 1977 the interest rate structure was as before, i.e. the discount rate for loans in the first tranche plus 1.5 percentage points for each additional tranche. On 9 May 1977 the interest rate charged in tranches 3–5 were raised to the discount rate plus 3.5, 5.5 and 7.5 percentage points respectively.

Figure 1.13 shows how the characteristics of the lending facilities changed during the two decades from 1965 to 1985. When the discount rate was changed in February 1978 there were also changes made for the third to fifth lending tranches.

1.6.5 Norges Bank market papers 1977–1985

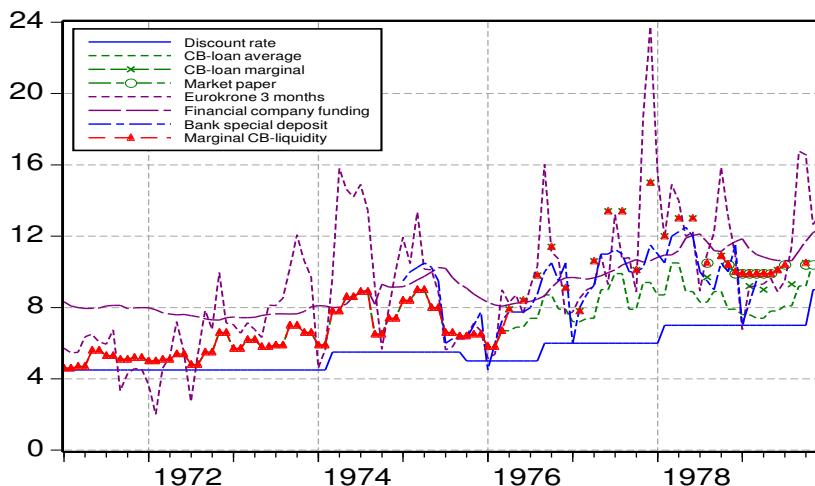

In 1977 Norges Bank started to issue a market paper with 90 days maturity. First as a trial arrangement from March 1 1977, but the arrangement was made permanent from December 1978. The purpose was to introduce a market oriented instrument which could be used in a flexible way to withdraw excess liquidity from the money market. From July 1982 the maturity could differ from 90 days and was decided discretionary by Norges Bank.⁵⁶ In August 1978 the banks were offered market papers (with 90 days maturity) in four rounds. The price quoted corresponded to effective yields of 10.5 per cent in round one (7 and 14 August), 10.4 per cent (November) and 9.9 per cent in the final round (December). In 1979 and 1980 the banks were offered market papers on a fairly regular basis, i.e. nine rounds in 1979 and five rounds in 1980. The banks' demand for the market paper declined in 1981 and only small volumes were traded. During 1982 through 1985 Norges Bank offered market papers to regulate bank liquidity, but since the liquidity situation in general was quite tight, only small volumes were traded. Norges Bank decided to phase this arrangement out in 1985.

1.6.6 Norges Bank interest rates 1971–1979

Figure 1.15 shows the average and marginal lending rates under Norges Bank's lending facilities. From August 1978 we also report the effective yield on Norges Bank's market paper. Before 1976, we have set the marginal liquidity rate equal to the average interest rate on Central Bank loans. This corresponds fairly well with the 3 months Eurokrone rate in this period, although the latter is significantly more volatile due to frequent episodes with distress in the foreign exchange markets in the 1970s. From February 1976 we have set the marginal liquidity rate equal to the marginal rate on Central Bank loans reported in Norges Bank's Quarterly Bulletin. For the period 1975–1978 we find these estimates to be reasonable compared with the 3 months Eurokrone rates and the interest rate on special deposits in banks which is available from January 1975 (cf. section 1.5 above and Table 1.C.1). The marginal liquidity rate picks up some of the fluctuations in the 3 months Eurokrone rate in 1976–1978 which are due to distress in the foreign exchange markets. From August 1978 we have used the maximum of the effective yield on Norges Bank's market paper and the marginal rate on Central Bank loans as our estimate of the marginal liquidity rate. This principle is followed until the automatic lending facility is revoked in March 1986.

⁵⁶See Circular (*Rundskriv*) 21/1982 and the Annual Report for 1982 (p. B32). For a detailed description see the Annual Report for 1977 (p. 43) and 1978 (p. 28).

FIGURE 1.15 Norges Bank interest rates 1971–1979. The interest rate on marginal CB-liquidity is plotted against the 3 months NIBOR rate and other money market interest rates, in per cent.

1.6.7 Revisions of Central Bank lending facilities in 1979 (A- and B-loans)

In January 1979 the automatic lending facility was subject to a major revision. The amount of total bank lending had shown a strong increase in 1978 despite attempts to curb lending using supplementary reserves. In order to limit bank lending and improve credit market regulations, but without resorting to §8 of the Monetary and Credit Policy Act,⁵⁷ the monetary authorities introduced a new lending facility called B-loans. The lending facility was split in an *automatic* part (A-loans) and a *conditional* part (B-loans). The availability of B-loans created an extra loan facility for banks which had fully exploited all tranches of the A-loan facility plus the liquidity buffer. The background for introducing B-loans was the view that quantitative regulations under §8 of the Monetary and Credit Policy Act were distortive as they affected all banks in a situation in which the monetary authorities only aimed at curbing bank lending for a couple of banks. Thus, the intention of B-loans was to introduce a more selective instrument which only affected banks who had already exploited their entire quota under the A-loan facility. These banks would have to accept quantitative restrictions on their lending growth for a period of six months once they entered the B-loan facility, and would hence selectively enter a control regime with quantitative regulations of their lending growth. In order to force a larger fraction of banks under direct lending control, the total loan liquidity quota under the

⁵⁷§8 of the Monetary and Credit Policy Act provides the possibility for the monetary authorities to impose supplementary reserve requirements on banks. The supplementary reserves were proportional to excess growth in bank lending and were placed in non-interest bearing deposits in Norges Bank. In practice this worked like a direct regulatory instrument to curb bank lending.

A-loan facility was reduced by 55 per cent.⁵⁸

When Norges Bank changed its discount rate from 7 to 9 per cent on November 30 1979, the interest rate differentials between the different tranches under the A-loan facility were reduced to one percentage point.

1.6.8 Further revisions 1979–1986

In order to achieve further control over the banks' lending growth, the entire A-loan facility was suspended between November 1979 and February 1980 to force all banks into positive B-loan positions. When the suspension of the A-loan facility was lifted 1 March 1980, the size of each loan tranche was decreased by 50 per cent for the lending period March–April 1980. At the same time Norges Bank issued market papers with 12.5 per cent interest rate which was also the interest rate charged for B-loans. In order to smooth liquidity effects due to seasonal tax payments, an extra tranche was introduced for May–June 1980. When the 12.5 per cent market paper was redeemed on June 2, the interest rate on B-loans was reduced to 11.5 per cent (the discount rate + 3.5 per cent) simultaneously.

Norges Bank suspended the 2nd and 3rd loan tranche under the A-loan facility from September 1980 through December 1980 in an attempt to control growth in bank lending. However, these measures were inadequate and in January and February 1981 the lending facility was again truncated by cutting the three first loan tranches by 50 per cent. The lending facility was restored to its normal level on March 1 1981. This attempt to control bank lending was not successful and from May 1981 direct regulations (§8 in the Monetary and Credit Policy Act) were introduced. On May 15 the interest rates charged for tranches 2 and 3 were increased, and at the same time the interest rate on B-loans was increased from 11.5 to 12.5 per cent.

On March 1 1982 the Central Bank B-loan facility was changed into a three-tranche system with a corresponding increase in the severity of restrictions imposed by the monetary authorities. At the same time the liquidity buffer was suspended. On the background of relatively moderate lending growth from commercial banks in the first part of 1982, the §8-regulation was lifted for commercial banks and at the same time adjusted for savings banks to encompass all loans, not only loans to households. Total bank lending increased during the spring of 1982, and so did the banks' aversion against B-loans which would impose severe quantitative regulations (at the individual bank level) for a period of six months. The three B-loan tranches were significantly increased from July 1982 and the interest rate was set to the same level for all A- and B-loans respectively (9 and 10 per cent). From January 1 1983 the §8 regulation was removed also for savings banks. Bank lending continued to grow and during the summer of 1983 extensive use of §8 regulation was reintroduced. The entire

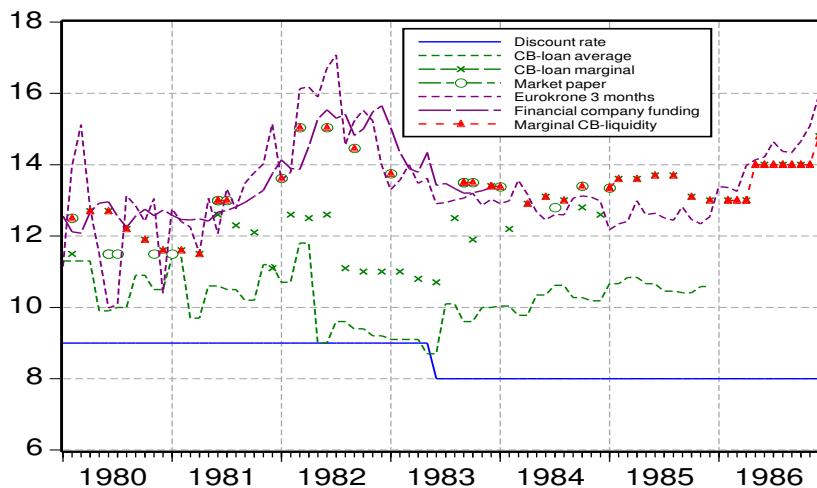

⁵⁸The A-loan facility was divided into three tranches with interest rates as before (discount rate, discount rate+1.5 per cent and 3 per cent respectively). On top of the A-loan facility a liquidity buffer was established where banks could borrow additional amounts in one of the next three two-month lending periods. The interest rate for this liquidity buffer was the discount rate + 3.5 per cent. Loans beyond the A-loan facility plus the liquidity buffer were given as B-loans and would automatically introduce additional regulations on the bank's lending growth. The interest rate on B-loans was set to the maximum of the discount rate + 3.5 per cent and the current yield on Norges Bank's market paper. Norges Bank also continued its lending facility on special terms (S-loans).

B-loan facility was suspended from July 1 1983 and replaced with a fourth A-loan tranche. The size of the extra A-loan tranche was twice the size of the ordinary ones. The respective interest rates for the four A-loan tranches was set to 8, 10, 12 and 14 per cent. In March 1986 the lending facility was changed completely and replaced by a simpler system, with a lesser degree of automatic lending.

1.6.9 Norges Bank interest rates 1980–1986

Figure 1.16 reports the marginal liquidity rate against the average and marginal Central bank loan rate under the automatic lending facility and compares these with the 3 months Eurokrone rate and the funding rate reported by some finance companies (cf. section 1.5 above and Table 1.C.1). Two points are worth mentioning. First, we note that in the 1980s the discount rate does not reflect the behavior of the marginal liquidity rate and from January 1987 the discount rate is discontinued. Second, whereas the marginal interest rate on Central Bank loans was a reasonable estimate of the marginal liquidity rate in the late 1970s we find that the gap between the yield on Norges Bank's market paper and the marginal interest rate on Central Bank loans widened significantly from mid 1981 to mid 1983. In this period we have seen that the lending facility was adjusted to force the banks into B-loans and direct lending control. The banks preferred higher funding costs in the money market to being forced into B-loans and we find that the marginal liquidity rate corresponds closely to the observed money market interest rates in this period. A tight liquidity policy was pursued throughout the period from 1983 to 1986 in order to curb the explosion in bank lending in this period. In this period the marginal liquidity rate was maintained at a high level (typically between 13 and 14 per cent). As we see from Table 1.1 the monetary authorities used all available regulatory instruments in 1983 in order to control bank lending, but as we have noted above, without success.

FIGURE 1.16 Norges Bank interest rates 1980–1986. The interest rate on marginal CB-liquidity is plotted against the 3 months NIBOR rate and other money market interest rates, in per cent.

1.6.10 Norges Bank interest rates 1987–2007

The banks' net borrowing position in Norges Bank was of moderate size until early in 1986. Norges Bank withdrew liquidity by selling foreign currency in the autumn of 1985 and the spring of 1986 to stabilize the krone exchange rate. The sharp drop in oil prices and the foreign exchange crisis in the spring of 1986 caused a dramatic outflow of capital. The automatic lending facility was discontinued and replaced with a simpler system with overnight loans (D-loans) with one tranche and an interest rate which, in principle, could change from day to day.⁵⁹ During the spring of 1986 Norges Bank supplied a substantial amount of liquidity without collateral in order to avoid a sharp increase in money market interest rates. This development is shown in Figure 1.17.

⁵⁹For each bank, a quantitative limit (tranche size) applied to the maximum amount of D-loans which was available within a time frame of one month. In 1991 this time frame was reduced from one month to a half month.

FIGURE 1.17 A decomposition of Norges Bank net supply of liquidity to banks 1982–2007, in billions NOK.

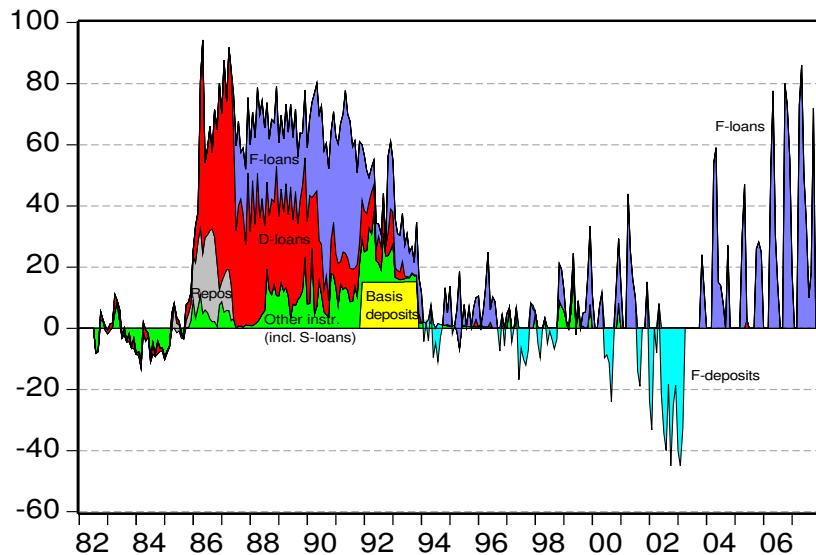

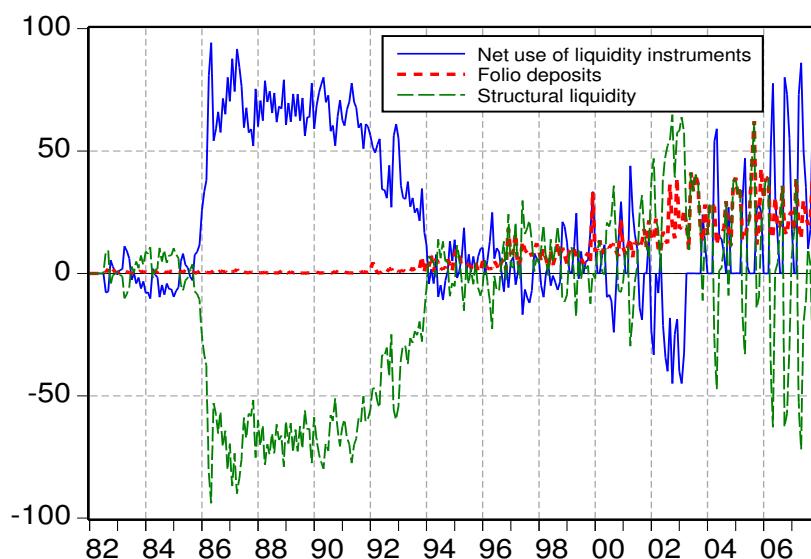

FIGURE 1.18 Structural liquidity 1982–2007 and its decomposition in folio deposits and net supply of Central Bank liquidity, in billions NOK.

In the fall of 1986 liquidity was also supplied through repurchase agreements and currency swaps. Due to reductions in the primary reserve requirements the banks had to hold more bonds to meet liquidity requirements stated in the banking acts. Repurchase agreements were therefore insufficient to supply the banks with necessary liquidity and this instrument has not been used as an instrument for liquidity control since 1987. In June 1987 Norges Bank introduced F-loans (fixed-rate loans) with maturities extending up to 12 months, to reduce the banks' dependence on overnight loans (D-loans), and help insulate the banks' lending rates against short term fluctuations in money market rates in times of turbulence in the foreign exchange market. F-loans were initially offered without collateral requirements. The foreign exchange crisis left Norges Bank with large, unsecured loans to banks when their solvency problems began in 1988. The banks' extensive debt to Norges Bank was first reduced in the fall of 1993 when banks' reverted to a net deposit position.

A requirement of collateral for D-loans was re-introduced in 1994 and a requirement of collateral for F-loans was introduced in 1999.⁶⁰ Figure 1.18 compares the development in the net use of liquidity instruments from 1982 to 2007 with the development in the banks' overnight deposits in Norges Bank and the bank *structural liquidity*, i.e. a liquidity measure net of Norges Bank's use of liquidity instruments.

Sight deposits became interest-bearing deposits as from 1 January 1991. Until summer 1993, however, the interest rate on banks' D-loans was Norges Bank's key rate. The banking system was in a permanent borrowing position vis-à-vis Norges Bank, and the interest rate on banks' D-loans formed a floor for short-term money market rates, see Figure 1.19. In the entire period from 1986 to 1993 the D-loan rate was the key administered interest rate set by Norges Bank. We have set the marginal liquidity rate equal to the interest rate on F-loans in this period, except in 1992 and the first five months of 1993 when we have used the D-loan rate. We see that the marginal liquidity rate picks up some of the variations in the 3 months NIBOR rate in this period, lying above the D-loan rate.

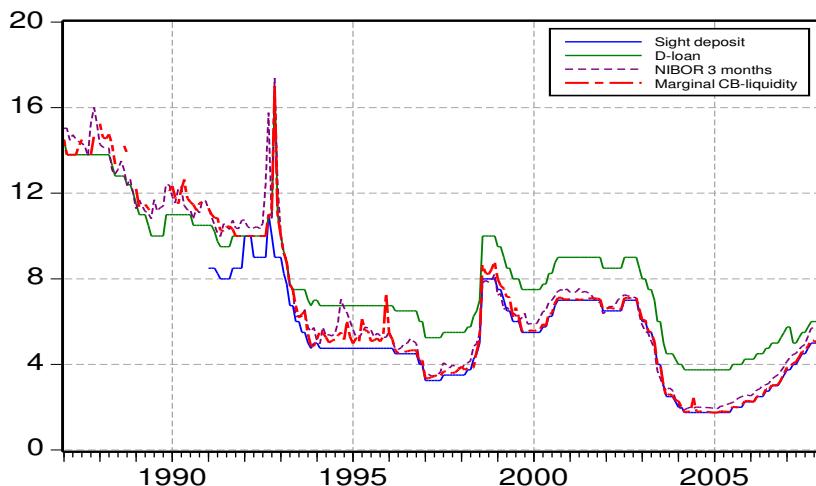

From autumn 1993 the banking system was generally in a net deposit position. Injections of liquidity through expansionary fiscal policy had gradually reduced the banks' need for Central Bank financing. Norges Bank started to manage short term money market interest rates within an interest rate corridor. The 'ceiling' of the interest rate corridor was the D-loan rate and the 'floor' was the sight deposit rate.⁶¹ The D-loan rate and the sight deposit rate were subject to several reductions through January–August 1993. In May 1993 the width of the corridor was increased to 1.5 percentage point to promote improved functioning of the interbank market, and since August 3 1993 the width has been 2 percentage points until it was reduced to 1 percentage point in March 2007.

The banks were still in a net borrowing position in the spring 1993 and the short term money market rates were higher than the D-loan rate. Thus, as there were no auctions in this period, we have set the marginal liquidity rate equal to the D-loan rate until May 1993. In June 1993, however, all money market rates were in the interior of the interest rate corridor and for this month we decided

⁶⁰See Bøhn and Selnes (1995, p. 19) and Gerdrup (2005) for further discussion of Norges Banks liquidity policy and its role as lender of last resort.

⁶¹See Bøhn and Selnes (1995) for a more detailed discussion.

FIGURE 1.19 Norges Bank interest rates 1987–2007. The interest rate on marginal CB-liquidity is plotted against the interest rates on D-loans, sight deposits and the 3 months NIBOR rate, in per cent.

to set the marginal liquidity rate equal to the midpoint between the D-loan rate and the sight deposit rate.⁶² From July 1993 onwards we have set the marginal liquidity rate equal to the maximum of the interest rate on F-loans and the interest rate on F-deposits. In the following years, Norges Bank frequently used fine-tuning liquidity instruments with a view to keeping the krone exchange rate stable, and we observe substantial fluctuations in marginal liquidity rates within the interest rate corridor.

We see from Figure 1.19 that between late 1993 and late 1996 there were only a few changes in this corridor. In November 1996 and January 1997 the administered interest rates were lowered to stabilize the exchange rate against a strong appreciation pressure. We see that the marginal liquidity rate follows the sight deposit rate quite closely in this period. In the second half of the 1990s, the banking system's sight deposits in Norges Bank were large, and money market rates fell towards the floor of the interest rate corridor. From 1996 onwards the main changes in the interest rate on marginal liquidity have been initiated by changes in the administered interest rates on sight deposits and D-loans, rather than by liquidity operations. The marginal liquidity rate has only temporarily deviated from the sight deposit rate in this period, typically in periods such as 1998–1999 when oil prices dropped significantly and we experienced a prolonged period with turbulence in the foreign exchange markets. Since then, short-term money market rates have for the most part remained somewhat above the sight deposit rate.

⁶²See Chart 1.4 in Bøhn and Selnes (1995, p. 16) and data in Table 1.C.2 and Table 1.D.2 in the appendix.

1.7 Summary of key interest rates set by Norges Bank

Norges Bank liquidity instruments and their interest rates.

1818	Regional discount rates	Regional branches of Norges Bank set the discount rate which could differ between the different regions.
1892	National discount rate	A revised Norges Bank Act was introduced in 1892. A common discount rate applied to all branches.
1965	New Central Bank lending facilities.	A new Monetary and Credit Policy Act was introduced in 1965 along with substantial changes in the Central Bank lending system. The banks were subject to a lending system based on two-month lending periods and an increasing interest rate schedule which depended on the banks' utilization of Central Bank credit. The lending system was subject to frequent adjustments.
1977	Norges Bank market paper	Norges Bank started to issue market papers with 90 days maturity in order to promote the use of <i>market-oriented</i> liquidity instruments.
1979	Foreign currency swaps and forward agreements	In order to control bank liquidity Norges Bank entered the foreign exchange market buying and/or selling e.g. USD against kroner in the spot or forward market, ^a
1985	T-bill yields	The market for short term certificates issued by private banks, non-financial corporations or government sectors was reinvigorated. T-bills issued by the central government were typically for 3, 6 and 12 months.
1986	D-loan rate	From December 1986 the overnight lending rate (D-loan rate) was used actively to stabilize the exchange rate.
		The D-loan rate was the key administered interest rate set by Norges Bank until the summer of 1993.
1987	F-loan rate	Auction of F-loans with maturity up to 12 months.
		From 1994 the maturity of F-loans has only exceptionally been more than two weeks.
1991	Sight deposit rate	From January 1991 private banks earned a positive interest rate on sight deposits in Norges Bank. From 1996 the sight deposit rate has been the key administered interest rate set by Norges Bank.
1992	F-deposit rate	Auction of F-deposits with maturity up to two weeks.

^aWhereas spot transactions affect bank liquidity immediately, transactions in the forward market affect liquidity on a future date usually in one to three months. A swap transaction combines the two such that the spot transaction is reversed on a prespecified future date.

1.8 Notes and sources to appendix tables

Tables 1.A.1 and 1.A.1

Discount rates at the various branches of Norges Bank 1818–1892 A survey of discount rate changes at the various branches written in the early 1950s is in the archives of Norges Bank at the Norwegian Public Record Office (*Riksarkivet*), catalogued under the item *Direksjonsarkiv D2/0209*. There are some gaps in the list, particularly before 1858. Some additional information was obtained from the annual reports of Norges Bank regularly published in Norwegian Parliamentary Papers (*Stortingsdokumenter*), but prior to the the 1860s the information on discount rate changes was somewhat incomplete concerning several branches here as well – the Board's report included only those discount rate changes that had been *reported* to the main office. This is by itself an interesting piece of evidence regarding the decentralized character of Norges Bank's operations at the time. For the period between December 1853 and January 1858 information on discount rate changes of the Skien branch were found in the local newspaper *Correspondenten*. For the early years there is also some additional information in Rygg (1950).

Discount rates 1893–1986 A full list of discount rate changes from October 1818 to the end of 1979 (before 1893 at the Christiania branch only) was published in the Annual Report of Norges Bank in 1979, p. E10. For the years 1980–1986 such information was taken from various issues of *Penger og Kreditt*.

Deposit rates at savings banks terms The dates of changes in the savings deposits rate at the Christiania (Oslo) Sparebank up to 1921 can be found in Vogt (1922). Similar data can be updated from *Kierulfs håndbok over norske obligasjoner og aksjer*. Data for Den norske Creditbank are from Hertzberg and Rygg (1907), for Christiania Bank og Kreditkasse from Engebretsen (1948).

Tables 1.B.1 and 1.B.2

The interest rates fixed on Treasury bills 1941–1985 are taken from the annual reports of Norges Bank and the special report covering the war years (*Norges Bank under okkupasjonen*, Oslo, 1945).

Tables 1.C.1 and 1.C.2

Eurokrone rate Before July 1972 data on the three-month rate on Eurodollar deposits in London, middle-closing rates quoted on the last working day of the month, are taken from International Financial Statistics tapes and Bank of England Quarterly Bulletin, data on spot and forward exchange rates from International Financial Statistics tapes and quotations provided by Den norske Creditbank. From July 1972 to the end of 1986 all primary data (eurodollar rate, spot and forward exchange rates) are from the primary sources underlying the CUMIX database developed by Schilbred (1990).

Other money market rate Private information from finance companies (Jøtun, Nevi).

Table 1.D.1– 1.D.3

Variables recorded in Table 1.D.1 (end-of-month observations): *Discount rate* is recorded from Table A1.1, *CB-loan average* and *CB-loan marginal* are recorded from various vintages of Norges Bank Quarterly Bulletin (*Penger og Kreditt*) and annual reports. These are also the main sources for all individual interest rates in the Norges Bank lending facility 1965–1986.

Variables recorded in Table 1.D.2 (end-of-month observations): *Discount rate* is recorded from Table A1.1, *CB-loan average* and *CB-loan marginal* are taken from various vintages of Norges Bank Quarterly Bulletin (*Penger og Kreditt*) and annual reports. The same holds for the yield on Norges Banks *Market paper* over the period 1978–1985. The administered interest rates *D-loan* and *Sight deposit* are recorded from Norges Banks web-page. The monthly series for *F-loan* and *F-deposit* have been calculated on the basis of available auction data since the first F-loan auction was held in 1987. In total we have processed data from more than 1150 auctions according to the same principles as Norges Bank uses when it reports weighted F-loan and F-deposit data on a monthly basis in Norges Bank Quarterly Bulletin (*Penger og Kreditt*). The series for *Marginal liquidity* is a combination of data from *Discount rate* (before 1966), *CB-loan average* (1965:1–1976:3), *CB-loan marginal* (1976:4 1981:5) (with the following exceptions when we use *Market paper* (1978:8,1978:11,1979:1–1979:5,1979:7–1979:8,1980:2)). Then we use *Market paper* (1981:6–1985:1) with the following exceptions when we use the interest rate on *CB-loan marginal* (1983:12,1984:3–1984:8). *CB-loan marginal* is also used for 1985:2–1986:2 after which we set *Marginal liquidity* equal to *D-loan* (1986:3–1987:5) and *F-loan* (1987:6–1991:9). Then we use *D-loan* (1991:10–1993:5), (*D-loan+Sight deposit*)/2 (1993:6), and finally we set *Marginal liquidity* equal to max(*F-loan,F-deposit*) (1993:7–2007:10).

Variables recorded in Table 1.D.3 (quarterly averages): Calculated on the basis of data in Table 1.D.2.

CHAPTER 2

A reconstruction of the balance sheets of savings banks in Norway 1822–1875

Jan T. Klovland¹

Savings banks were quantitatively the most important group of financial intermediaries in Norway in the nineteenth century. Although commercial banks gradually increased their share of the business of banking, it was not until 1898 that commercial banks surpassed the savings banks with regard to the volume of loans to the public. This chapter is devoted to a reconstruction of the balance sheets of individual savings banks in the period 1822 to 1875. We also give revised estimates of aggregate deposits, own funds, total assets and loans for all years through 1918. The new data base allows us to compute a liquid asset ratio for savings banks, which - after adjustment for trend movements - turns out to be a sensitive barometer of financial conditions in Norway. It seems very often to be the case that when savings banks did well and expanded their activities the nation prospered as well. Once again, this highlights the savings banks' key role as the most important financial intermediaries of the nineteenth century.

¹Jan T. Klovland is professor at the Norwegian School of Economics and Business Administration in Bergen and special adviser to the Research Department of Norges Bank.

2.1 Introduction

Savings banks were quantitatively the most important group of financial intermediaries in Norway in the nineteenth century. Commercial banks gradually increased their share of the business of banking, surpassing the savings banks in 1898 in terms of loans to the public, but only in 1915 with respect to the volume of deposits held by the public. Some of the savings banks were relatively large by Norwegian standards; in 1870, for example, there were six savings banks among the ten largest banks in the country.² Thirty years later this number had shrunk to four, but the largest bank in Norway in the year 1900, as measured by deposit volume, was in fact a savings bank – Christiania Sparebank.

Although some town banks were relatively large, this was not typical of savings banks – the majority of savings banks were indeed quite small. At the end of the period covered in detail here, in 1875, our data base comprises 284 savings banks in operation.³ The great number of small banks were located in rural areas, and it was only some of the largest ones of these that operated with total assets above 100 000 speciedaler (NOK 400 000).⁴

The great majority of savings banks were *chartered banks*, i.e. they were given permission by the government to operate as savings banks according to the Savings Bank Act of 1824 by applying for approval of their statutes. These banks were allowed to charge five per cent interest on mortgage loans (instead of the general maximum of four per cent), enjoyed exemption from some stamp duties and were given some other minor privileges.⁵ However, a few banks operated as savings banks without being chartered. Some banks did so for a few years after being established, then applying for authorization as a chartered bank; other banks existed for a long period without formal approval from the authorities. One reason for a savings bank not to operate as a chartered bank was to avoid the restriction of four percent on the maximum rate of interest paid to depositors. The issue came to the forefront in 1849 when Akers Sparebank temporarily opted to renounce its charter because the government refused to accept a change in its plan that enabled the bank to give more than four per cent interest to its depositors.⁶ In 1857 an amendment to the Savings Bank Act raised the maximum deposit rate to six per cent, but there were still some banks that operated without a formal approval of their statutes.

In the existing savings banks statistics the practice of including the few unchartered banks varies from bank to bank and over time. Here, we make no distinction between the two types of savings banks, trying to include all banks that were operating as savings banks. In a few cases it is a matter

²Christiania Sparebank and Bergen Sparebank ranked as number 3 and four, respectively, after the two largest commercial banks, Christiania Bank og Kreditkasse and Bergens Privatbank.

³Four savings banks established between 1845 and 1860 had gone out of business by 1875: Horrig, Næs Jernverk, Aurland and Skibtvedt. It should also be noted that some of the earliest established banks had been closed for a number of years before being reestablished at a later date. This concerns Moss Sparebank, founded in 1826, but being out of business between 1830 and 1842, and Tønsberg Sparebank, which also began operations in 1826, but which was inactive between 1832 and 1846.

⁴To put the size of the banks in perspective it can be noted that a bank with total assets of 100 000 speciedaler in 1875 would only be 2.9 per cent of the size of Christiania Sparebank.

⁵Rønning (1972).

⁶See Schreiner (1943, pp. 52–68.).

of judgement whether a bank should be classified as a savings bank, since some of the banks in question were organized with some of the features of a commercial bank. The typical savings bank was established by collecting funds from private individuals to form the share capital of the bank (*grunnfond*). In rural areas we also see many cases of savings banks being formed by converting the funds of the local common grain store into a bank.⁷ These funds might be considered either as a permanent donation, as a loan to be repaid after some years with, or without, interest, or as an interest-bearing deposit with a minimum maturity of some years. A crucial distinction between a commercial bank and a savings bank, applied here, is that the share capital of the former was invested with a view to obtain dividends from the bank's activities, while in the case of a savings bank the altruistic motives of the founders were more important.

In practice, there are some cases that are not clear cut. One example is Rennesø Spareskillingsbank, which was established in 1854.⁸ In Brandal (1989) it is listed among commercial banks, but its status is somewhat undecided until it is definitely reestablished as a commercial bank in 1910 under the name of A/S Rennesøybanken. We know that it was entered into the Norwegian Registry of Firms (Handelsregisteret) as Rennesø Spareskillingsbank in February 1875.⁹ From that date (maybe also earlier) it appears to be organized as a general partnership (*ansvarlig selskap*) formed among a large number of local citizens. This example shows the fact that in some rural districts a distinction was sometimes made between the 'public' savings bank, which had close ties to the local authorities, and the 'private' bank, which was typically founded and run by a group of individuals as a general partnership. The equity of the latter type of banks was typically referred to as share capital, but surpluses were accumulated in the bank's own fund (*grunnfond*) rather than paid out to share holders, thus operating more in the tradition of a savings bank. We have considered Rennesø Spareskillingsbank as a savings bank here, in accordance with the existing savings banks statistics which listed the bank through 1881, but thereafter it disappears from the banking statistics.¹⁰

An additional problem is caused by the fact that several banks adopted the name of 'sparebank' (savings bank), but it turns out that the ownership structure indicates that they were more typical of the commercial bank category, and these banks have therefore been classified as commercial banks here.¹¹ However, the total of deposits and loans belonging to banks that may have been wrongly classified is trifling.

This chapter is devoted to a reconstruction of the balance sheets of individual savings banks in the period 1822 to 1875. We also give revised estimates of aggregate deposits, own funds, total

⁷Rønning (1972).

⁸See Rennesøy Local Council (1938, pp. 151–156) for a short history of the banks in this region.

⁹Den Norske Rigstidende 5 April 1875, p. 1. The same page contains a similar announcement concerning Hjelmeland Sparebank, which according to Brandal (1989) also was a commercial bank. After 1881 Rennesø Spareskillingsbank disappears altogether from the savings banks statistics until it reappears as Rennesøybanken in the commercial bank statistics in 1917.

¹⁰A similar case is Strandvig Privatbank, which was established in 1868 by a faction of the board members of Fus Sparetbank (Søndre Bergenhus Amt). This bank also seems to have been organized as a general partnership, closer to being a savings bank than a commercial bank despite its name. It was amalgamated with Fus Sparetbank in 1883, see Fus Sparetbank (1958, pp. 34–40).

¹¹See the appendix to chapter 3 in this volume for a list of such banks.

assets and loans for all years through 1918. These data are corrected for errors and omissions in the published savings bank statistics of this period.

2.2 Sources of balance sheet data for savings banks

Two facts make it an arduous task to collect a reasonably complete set of savings banks's balance sheets before 1860: the great number of banks – by 1860 at least 173 banks had been established – and the fact that the balance sheets have to be extracted one by one from a number of different and partly rather unwieldy sources. This section contains a review of the various sources and some reflections on their quality and reliability.

2.2.1 The sources

The first year covered by the annual savings bank statistics (henceforth referred to as *SBS*) is 1869, which thus marks a watershed regarding sources of balance sheet data. We first review the adequacy of the data in *SBS*, then dealing with the period 1822 to 1868.

Savings banks statistics

From 1870 to 1879 the statistics was published by the Ministry of Finance.¹² The quality of the statistics was markedly improved when Statistics Norway took over the responsibility of collecting the data and processing the returns beginning with the year 1880. There are several problems with the *SBS* prior to 1881 that need to be dealt with to obtain a satisfactory data base for these years: (1) missing or wrongly classified banks (2) missing data or previous year's figures inserted for individual banks (3) transcription and printing errors, and (4) only total figures for each bank's holdings of mortgage loans and securities were published.

There were various reasons why banks were left out of the annual returns. The practice of including unchartered banks varied from bank to bank; some were included in the 1870s, but these were weeded out in the early 1880s when their status had been clarified. The most important of the unchartered banks was Bergens Skillingbank, which was founded as a savings bank in 1857, but omitted from all banking statistics until it was reorganized as a commercial bank in 1919. Another important case is Stavanger Sparekasse, established in 1851, but not included in *SBS* until 1881, after obtaining approval of its statutes in 1878.

From 1906 *SBS* provides summary information on 21 'unauthorized' savings banks, some of which have been taken into account throughout the period here. In that year the aggregate deposits

¹²The issues prepared by the Ministry of Finance include *Tabeller vedkommende Norges Sparebanker i Aarene 1870, 1871 og 1872* (Christiania, 1876), later issues with similar titles covered the years 1873, 1874 and 1875 (Christiania, 1878), the years 1876, 1877 and 1878 (Christiania, 1880), and the year 1879 (Christiania, 1882). The first issue also contained data for 1869. It is unfortunate that Statistics Norway failed to include data for some years bewtween 1869 and 1874 when it published its 1948 issue of Historical Statistics (*Statistiske Oversikter 1948*), which is the only survey which purported to reproduce annual figures for this period.

of these banks amounted to NOK 10.7 million. The largest banks have already been included in our sample prior to this,¹³ and one bank (Røkens Sparebank) was actually a commercial bank, so that the net addition to aggregate savings bank deposits not included previously is NOK 2.8 million. This fact creates a minor break in the time series in 1906; aggregate deposits rose by 0.67 per cent due to the new information, and similar breaks must be expected for the other components of the balance sheet.

In the years before 1881 the *SBS* data had to be supplemented by information on a number of other banks that were left out for various reasons. It was often the case that newly established banks failed to show up in the *SBS* in the first years of their existence. In some cases it appears that the Ministry of Finance had some difficulties with obtaining the annual accounts from individual banks, which led to the use of previous year's figures or the exclusion of the bank from the tables.¹⁴ Before Statistics Norway was given charge of the *SBS* in 1880 the published returns contain quite many transcription and printing errors. Obvious misprints have been corrected and figures have been revised in all suspected cases when the data could be checked against the original returns in the National Archives or other sources.

A final problem with *SBS* prior to 1880 is the fact that no separate estimates of mortgage loans (*pantelån*) were published. Such loans were lumped together with bonds and other securities. Figures for the mortgage loans of individual banks have been extracted from the original returns in the National Archives for the years 1860–1878 (see below for further information on this source); the 1879 returns are missing in the archive and only figures from newspapers or anniversary publications were available for this year.

The quinquennial reports of the county governors and other official sources

Beginning with 1845 the Quinquennial reports of County Governors (*Amtmennenes Femårsberetninger*) contain statistics relating to nearly all savings banks, excluding only a few unchartered or newly established banks.¹⁵ The information given is restricted to deposits, own funds and total balances. There is in general no information on loans or other assets.

Public archives

There are many references in the County Governors' reports to the fact that one of their regular duties was to provide the government with summary statements of the savings banks' annual accounts.¹⁶ In general these statements seem to have contained information on deposits, own funds and total

¹³This concerns Bergens Skillingsbank (deposits in 1906 amounted to NOK 5.6 million), Spareforeningen Bien (NOK 1.3 million) and Levanger Haandværkerforenings Sparekasse (NOK 0.6 million).

¹⁴Alten Sparebank, the only bank in Finnmarken Amt, mysteriously disappears from *SBS* in the years 1876 to 1879. The original returns (except 1879) sent in to the Ministry by the bank have been recovered in the National Archives.

¹⁵The full title of the reports are *Beretning om Kongeriget Norges økonomiske Tilstand i Aarene 1836–1840* etc. Some less systematic information can also be found in the 1836–1840 volume and earlier issues.

¹⁶For one example see the report for the years 1840–1845, p.59, concerning Christians Amt.

balances only.¹⁷ In 1861 all savings banks were required to report their accounts to the Ministry of Finance annually.¹⁸ From this year the original documents can be found in the National Archives, comprising the great majority of savings banks.¹⁹ This source has been exploited fully here to construct a fairly complete data base of the main balance sheet items for the years 1861–1868. The same source was used for some minor additions and revisions to the published figures for the years through 1875 and for extracting figures for mortgage loans of individual banks between 1869 and 1878.

In addition to the material in the National Archives it turned out that the State Archive of Stavanger contained valuable information on some of the region's savings banks that were not available elsewhere, in particular a complete record of the accounts of Stavanger Sparebank from its founding year in 1834.²⁰

Anniversary publications of savings banks

Especially for the early years, before access to the nearly complete sources after 1860, the numerous anniversary publications issued by savings banks form a very useful set of sources. Most banks have issued such publications in connection with the centenary of their foundation, sometimes also after having been in operation for fifty, seventy-five or more than one hundred years. Some publications contain a complete set of annual figures relating to the main balance sheet items, but many banks published these for selected years and for deposits, funds and total balances only. In many cases it turns out that the accounts of the early years of the bank's existence are no longer available. Although being rather incomplete, these volumes constitute valuable sources of individual banks' balances. A list of anniversary publications published before 1945 that were consulted here can be found in the appendix.

Contemporary newspapers

The annual accounts of the local savings banks were often – but not always – published in one of the local newspapers, sometimes also in newspapers with a nationwide circulation.²¹ For this reason newspapers is one of the major sources, especially in the period before 1860. An extensive search has been made in a number of contemporary newspapers, which are listed in the appendix.²²

¹⁷ Until 1851 savings banks were the responsibility of the Ministry of Church (*Kirkedepartementet*), after this these matters were transferred to the Ministry of Finance. Regrettably, few traces of this source material have been found in the National Archives before 1860.

¹⁸Egge (1972, p. 132).

¹⁹The annual savings bank accounts for the period 1861 to 1878 are catalogued as *Finandepartementet Ekspedisjonskontor C*, shelf numbers 3A25233/3A25234, boxes 59 through 66. A few banks each year and practically the whole of the 1879 file are missing.

²⁰Stavanger Sparebank, which was one of the major regional banks of the country, failed in 1889, see Rygg (1954, pp. 176–183).

²¹These were chiefly the Christiania newspapers *Morgenbladet*, *Christiania Posten* (beginning 1848) and *Aftenbladet* (beginning 1855).

²²In most cases the statements of account or summary information thereof were published in the months from January to April, but there are also numerous examples of such information being published later, even in the final months of the year. In this period many local newspapers printed four pages of each issue twice or three times a week. The most comprehensive

Unfortunately, there are substantial gaps in the National Library's holdings of microfilmed local newspapers for this period.²³ Some regions lacked newspapers in the 1840s and 1850s, or they are no longer available. This applies in particular to some rural areas in the interior of southern Norway.²⁴

2.2.2 The quality and accuracy of the data

There was no standard setup for the original annual accounts published in newspapers or found in archive sources. The level of detail, completeness and transparency may vary greatly between banks, and even for a single bank over time. In some cases it is a matter of interpretation which items belong to deposits, own funds and temporary loans from individuals or other banks. There are also some minor problems of accuracy. These are mainly related to minor discrepancies between the first published statement and the final version due to auditing, rounding (we give rather detailed figures in the appendix, rounded to the nearest speciedaler) or subsequent discovery of summation errors. For this reason there might be minor differences between figures found in different sources.²⁵

The figures published in the anniversary publications must be subjected to a close scrutiny with respect to reliability. When checked against original accounts it appears that in quite a number of cases the published figures are based on incomplete data or a misunderstanding of the accounts.²⁶ In cases where there are conflicting information from various sources the data published in the Quinquennial Reports of the County Governors and original returns published in newspapers have as a rule been given precedence over the data in anniversary publications.

2.3 The balance sheet items

2.3.1 Deposits

The savings banks originally offered only one type of deposits, a kind of time deposits referred to as deposits at savings bank terms. Formally, such deposits were subject to a notice of withdrawal,

newspaper, *Morgenbladet*, appeared all days, including Sundays.

²³Most of the material was filmed in the 1950s, apparently destroying the paper copies at the same time. It is a sad fact that the quality of some of the film reels has deteriorated to the extent that the copies are no longer eligible. That applies for example to the Arendal newspaper *Vestlandske Tidende* for some years in the mid 1850s. This newspaper typically published the accounts of several town banks in the Agder region (Nedenæs Amt) that cannot be found elsewhere.

²⁴The regions with particularly thin surviving newspaper sources were (the counties, i.e. *Amt*, are given in parentheses): Sogn (Nordre Bergenshus Amt), Hardanger (Søndre Bergenshus Amt) as well as central parts of the interior of southeastern Norway (Christians Amt, Buskerud Amt).

²⁵There is but one rather curious example of annual accounts published in newspapers that had to be rejected due to suspected errors in the data. Gjerpen Sparebank (established 1849) published its annual accounts regularly early in the following year in the Skien newspaper *Correspondenten* in the 1850s through 1857. No accounts were published for the next two years until 15 December 1860, when rather incomplete statements appeared for 1858 and 1859. It turns out that the figures deviate considerably from those later published in the bank's history written by Hareide (1948). The strange figures may presumably be related to the bank cashier's embezzlement that were subsequently discovered. He claimed to have lost the money box while crossing the river on his way to the bank one morning, but the box was found fifty years later bricked up in his house (see Hareide (1948) or Gardåsen (1998) on this episode).

²⁶In some cases there is a confusion of deposit flows (funds deposited in the course of the year) and the stock of deposits at the end of the year.

most typically at three months. Practice varied somewhat between banks, and over time, as to how strict these rules were exercised. There might also be different rules in each bank regarding a number of other conditions associated with the calculation of interest on the deposits, the maximum size of deposits, and so on.²⁷ After mid-century it seems that there was a convergence towards simplifying the deposit terms, in general abandoning particular restrictions and waiving the rules regarding the notice of withdrawal.

After 1900 some large savings banks began to offer demand deposits, but these played only a minor role until well after World War I.

2.3.2 Equity

When a savings bank was established, capital could be raised in many ways: donations from private individuals, permanent or temporary loans or conversion of capital previously locked up in local community grain stores. In a few cases there is some ambiguity whether such funds should be classified as deposits, equity or some form of loan capital. This problem occurs mostly in the first years of the bank's existence. As far as possible such funds have been treated with a view to preserve consistency over time, keeping an eye on the way the funds were treated in the accounts in later years.

When the bank was well established, the equity grew by accumulating the operating surpluses less any donations for charitable purposes or to local community projects. Significant reductions in a savings bank's own funds from one year to the next could come about by writing off bad debts, paying off funds to the original founders, or, in a few cases, by splitting the bank into two or three separate entities.²⁸ There were – not unsurprisingly – quite a few cases of fraudulent behaviour on the part of the banks' cashiers which resulted in heavy losses and a diminished equity base.²⁹ Operating losses were not common in savings banks in this period except possibly in the founding years, because administrative expenses were low; for many years it was the rule that bank directors served without compensation, only the cashier was paid.

2.3.3 Loans

The dominant loan instrument throughout the period was *vekselsobligasjoner*, a kind of promissory notes endorsed by several guarantors. The debt formally fell due in three, four or six months' time

²⁷See Rønning (1972) for a discussion of such issues.

²⁸The main reason for splitting an existing bank seems to be that in many rural areas there was no undisputed community center; each part of the region wanted its own bank. This seems to have been the case when Eggedal and Krødsherred Sparebank were founded in 1851 by acquiring part of the funds of the previously established Sigdal Sparebank, see Mørch (1951). A similar case is the split of Hof Sparebank in 1861 into three banks, creating the basis for Aasnæs and Vaaler Sparebank as well, see Heier (1945).

²⁹The first case occurred already in 1827 in Christianian Sparebank, see Vogt (1922, pp. 28–31). Numerous other cases of fraudulent behaviour throughout the century are revealed in anniversary publications. One example of embezzlement on a large scale is the case of Ringsager Sparebank in 1858, in which case the loss amounted to all the equity and a quarter of the deposits. Amazingly, the bank survived due to a rescue operation from depositors and the local community, see Skappel (1928).

but in practice the bill was renewed after a ten percent downpayment of the principal. Ordinary trade bills were discounted by the largest town banks, but played a much less important role.

The volume of mortgage loans varied considerably between banks and also over time. In 1869 the two types of bills accounted for 89 percent of all loans and mortgage loans for 11 per cent.³⁰ We do not have complete annual figures for the distribution by loan type for previous years, but these figures may be reasonably representative for earlier periods as well, although the share of mortgage loans may have been somewhat higher before the late 1850s. It appears that the share of mortgage loans increased when the banks' liquidity was good, as in the boom years 1853 and 1854, and fell again during and after severe liquidity squeezes, as in 1857 and 1858. A dramatic example is provided by the actions taken by Christiania Sparebank in the autumn of 1857, when, after experiencing a severe drain of funds, the bank decided to call in all mortgage loans at the next due date, in most cases giving the debtors the option of converting the loans to *vekselsobligasjon* instead.³¹ In this bank the share of mortgage loans had always been substantial, often accounting for more than fifty percent of the loan portfolio. A renewable bill obviously provided more flexibility during a period of strained liquidity. From the 1850s investment in marketable securities in the form of government, Hypotekbank or municipal bonds provided an alternative outlet for surplus liquidity, and the savings banks gradually increased their holdings of such bonds.

The available information is generally less readily forthcoming for the asset side of the balance sheet than for the liabilities side before 1861. There are consequently more missing observations for loans than for the other items considered here. However, given the extremely simplified and stable structure of the savings banks' balance sheets in the period, the estimates of the loan figures are probably not far off the mark in the great majority of cases. Small savings banks in particular held only a small amount of liquid reserves – if any at all, see below – and loans regularly accounted for 95 to 100 per cent of their assets. Consequently, when figures for total assets are known, we know of course the upper limit of loans as well, and in the majority of cases the true figures are only a few per cent lower.

2.4 New estimates of the balance sheets of individual savings banks 1822–1875

Table 2.A.1 of the appendix contains annual data for the deposits of each savings bank for the period from 1822 to 1875. An extended table comprising similar data for own funds (equity), total assets and total loans, is not printed here, but it is available at the website.

The data for the individual banks are organized by the *amt*, which was the name of the twenty

³⁰These figures are derived from aggregating the amounts of mortgage loans of all individual banks. The annual savings banks statistics only give separate figures for mortgage loans beginning in 1880. In that year such loans accounted for 10 per cent of the total loan portfolio.

³¹Vogt (1922, p. 74 and p. 163). It was not until 1880 that Christiania Sparebank once again began granting new mortgage loans.

counties in which the country was divided for administrative purposes. The name of the banks are spelled in accordance with contemporary practice.

In order to provide a basis for an estimate of total deposits and loans, missing observations have basically been linearly interpolated between the known figures. These observations are printed in blue colour in the tables. In cases where data on total assets are known the missing loan figures have usually been estimated by multiplying total assets by the ratio of loans to total assets known from a previous or subsequent year. Usually the ratio of loans to total assets varied little from one year to the next, often being in the interval 95 to 100 per cent for a typical small savings bank. Sometimes the anniversary publications provide some clues as to the likely order of magnitude of these balance sheet items in a particular year, and this information has been taken into account as far as possible.

2.5 New estimates of aggregate key statistics for savings banks 1822–1918

Table 2.1 presents new aggregate estimates of the key balance sheet items and the number of savings banks in operation at the end of each year. These time series provide revised estimates of savings bank deposits previously published in Klovland (2004) and the number of savings banks and loans in Eitrheim et al. (2004). The final two columns show annual growth rates of total assets and an approximate measure of the percentage of total balances held as liquid assets, which is further explained below.

The estimates of the number of savings banks refer to banks that were open for business at the end of the year. Such data may deviate from the information that can be found in *SBS*, which gives the year in which the bank gained status as a chartered bank. There are a number of examples of banks that had been in operation for some time before they were given formal approval of their statutes by the government. Stavanger Sparekasse was established in 1850, but waited until 1878 to apply for a charter; the plan of Finnøy Sparebank was formally accepted in 1860 although the bank had been in business since 1852.³² Sørum Sparebank became a chartered savings bank in 1865 in connection with a partial reconstruction of Sørum Sparekasse (established in 1851), involving the community council as board members.³³ These are somewhat extreme examples; it was more common for a bank to obtain a charter about the same time as the bank was founded or within one or two years time.

The number of banks grew fairly steadily over the years considered here, except between the years 1829 and 1832, when two of the pioneer banks, in Moss and Tønsberg, closed down after failing to attract a sufficient number of depositors. The 1850s, the first half of the 1860s and the middle and final years of the 1870s are periods of particularly rapid expansion.

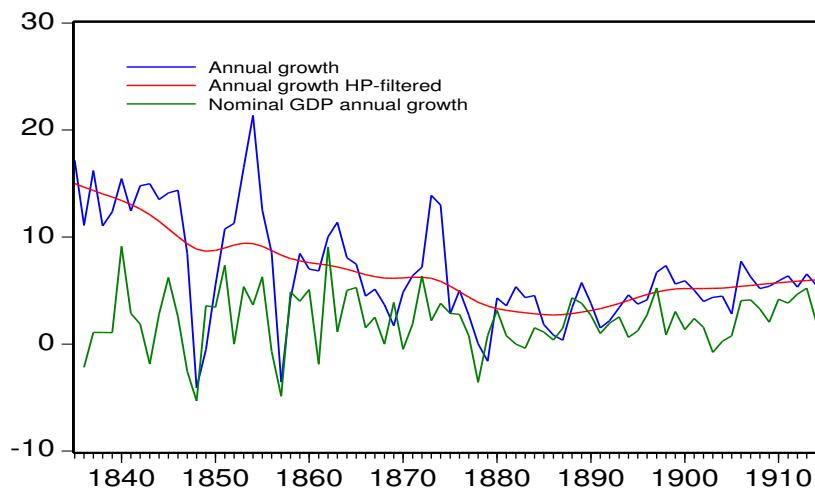

Table 2.1 contains annual data on four balance sheet items for the aggregate of all savings banks:

³²Stavanger Sparekasse (1900); Mjølsnes (1953).

³³Kongsvik (1965).

deposits, equity (own funds), total assets and loans. The growth rate of savings banks' total assets is visualized in Figure 2.1 for the period 1835 to 1914, thus excluding the founding years and the great inflation episode beginning with World War I. The annual rates of growth of total assets are shown together with a flexible trend growth curve and the annual growth rate of nominal gross domestic product.³⁴ It will be seen from the graph that the trend rate of expansion is falling from about 15 per cent in the mid 1830s to a secular low in the mid 1880s; from a level of slightly below 3 per cent it then starts to climb again, being fairly stable at 5 to 6 per cent from the mid 1890s until World War I.

FIGURE 2.1 Growth rates of savings banks' total assets and nominal GDP. 1835–1914. Per cent

The early years, from about 1830 to the mid 1840s, represent a period of uninterrupted high growth, but there are notably larger cyclical swings around the trend growth in the decades thereafter. The great commercial crises of 1848, 1857–1858 and the business cycle downturn at the end of the 1870s clearly affected savings banks, as aggregate assets fell in each of these episodes. We know from a great number of savings banks' anniversary publications that these episodes were years of severe drain on the banks' liquidity. In Christiania Sparebank deposits fell by 38 per cent in 1857; in Risør Sparebank the ratio between withdrawals and the inflow of deposits equaled 22 to 1 in 1858 and in the spring of that year the bank could no longer pay back deposits within due time.³⁵

The great boom years of the early fifties and seventies are also duly reflected in the aggregate figures; 1853–1854 and 1873–1874 are years of particularly rapid expansion.³⁶ These observations

³⁴The smoothed series of total assets are computed by applying a Hodrick-Prescott filter to the annual growth rates, with the smoothing parameter lambda set equal to 100. The underlying GDP data are from Grytten (2004).

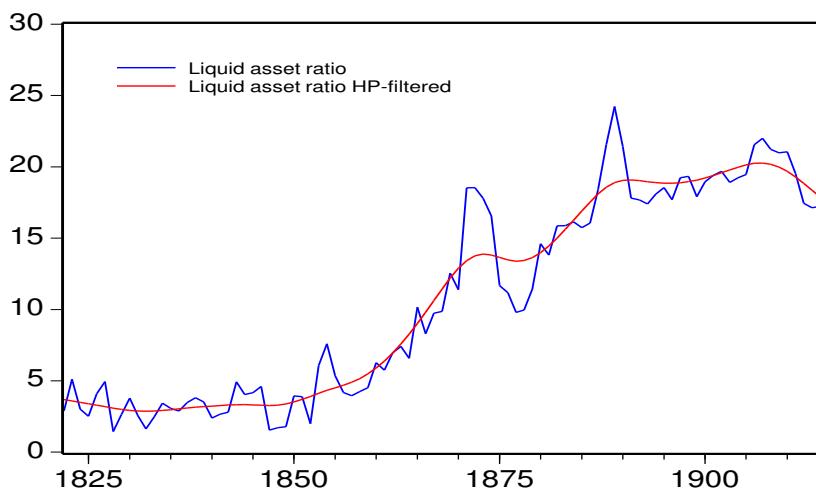

³⁵Vevstad (1935, p. 56).

³⁶So overwhelming was the surge of the inflow of deposits in 1853 and 1854 that many banks were reluctant to accept deposits beyond a certain amount from an individual depositor, invoking partly dormant paragraphs in their statutes which

highlight the fact that the savings banks could not escape the great international business cycle fluctuations and price level changes.³⁷

The composition of the balance sheet of a typical small savings bank in the early and middle part of the eighteenth century was extremely simple. On the liabilities side the items include own funds and deposits, on the assets side loans and cash.³⁸ In periods of ample liquidity, deposits in a larger bank might occur in the balance sheet, and in years of stringency, loans from the branches of Norges Bank, government loan commissions as well as from other savings or commercial banks frequently occurred. In the larger banks, and increasingly also in the medium-sized banks, a modest portfolio of marketable securities (Hypotekbank, government and municipal bonds) gradually became more widespread.

FIGURE 2.2 Savings banks' liquid asset ratio. 1822–1914

In general, the liquid assets of the savings banks were very small in the early years; from the 1860s to the 1880s, in particular, we see a trend movement towards a greater share of liquid assets. In Table 2.1 and Figure 2.2 the movements of the savings banks' liquid positions can be studied by reference to a statistic which (somewhat inaccurately) is labeled the liquid asset ratio (liquid assets as a ratio to total assets). Liquid assets is here defined as cash, deposits with other banks and securities. Because we do not have direct estimates of these items the liquid asset ratio has to be calculated as

specified an upper limit for each account. Examples of such practice are numerous, it was for example applied by Bergens Sparebank [(Fossen, 1998, p. 57)] and Akers Sparebank Schreiner (1943, p. 64).

³⁷This theme is further discussed in Rønning (1972).

³⁸It is not uncommon to see only one item, loans, on the asset side of the balance sheet in small savings banks – cash holdings were zero. In 1863, for example, it appears that at least seven banks were in this position (Hakedal, Urskoug, Elverum, Aamot, Lunde, Sirdal, Høiland). Many banks held only a few speciedaler in cash.

the difference between total assets and loans. Because of this the figures will also include various small items such as premises, furniture and money boxes. In 1882 such assets only accounted for 0.8 per cent of total assets;³⁹ from an inspection of a number of accounts for savings banks in previous years it seems likely that it was no greater in earlier years, and did not vary much from one year to the next.

Until October 1857 the maximum rate of interest that the chartered savings banks could offer their depositors was four per cent, then it was raised to six per cent. In 1887 all restrictions on interest rates were abolished. The extremely low liquid asset ratios of savings banks before the late 1850s are typical of a credit-constrained economy: there was a widespread excess demand for loans at the stipulated rates of interest which led many banks, in particular the small ones, to ration out new loans as soon as it was warranted by the bank's liquidity position. Such banks were highly vulnerable to periods of money market stringency, in particular during the years 1847–1849 and once again ten years later following the worldwide commercial crisis.

From the late 1850s we see a trend towards a higher liquid asset ratio; from the mid 1880s it usually fluctuated between 15 and 20 per cent.⁴⁰ The fluctuations around the trend value of the liquid asset ratio is clearly affected by business cycles and financial conditions. It rises markedly in 1853–1854, 1871–1874 and 1888–1890 – which are known to be periods of booming export revenues and easy money markets.

For the nineteenth century the liquid asset ratio of savings banks, when corrected for trend movements, is a sensitive barometer of financial conditions in Norway. Once again, this highlights these banks' key role as the most important financial intermediaries of this period. When savings banks did well and expanded their activities the nation prospered as well. This insight is not new – the newspaper *Correspondenten* in Skien wrote on 12 March 1853, that 'in general, the ebb and flow of the savings banks' stock of deposits is considered as a barometer of the region's general wealth'.⁴¹ Now we know more about *when* these ebbs and flows occurred, the challenge ahead is to increase our knowledge of what caused them and what their consequences were.

³⁹SBS for the years 1881 and 1882 p. VI.

⁴⁰The Savings Banks Act of 1887 had originally contained a paragraph that required the banks to hold at least ten percent of their assets in securities (bonds, shares in Norges Bank), but this met with fierce opposition and was abolished in 1903, see Egge (1972).

⁴¹'I Almindelighed ansees Sparebankindskuddenes Stigen og Falden som et Barometer paa Svwingingerne i den almene Velstand i Distriktet.'

TABLE 2.1
New estimates of key statistics for savings banks 1822–1918

End-of-year balance sheet figures are in 1000 kroner

Year	Number of banks	Deposits	Equity	Total assets	Loans	Growth rate total assets	Liquid asset ratio

TABLE 2.1
New estimates of key statistics for savings banks 1822–1918

End-of-year balance sheet figures are in 1000 kroner

Year	Number of banks	Deposits	Equity	Total assets	Loans	Growth rate total assets	Liquid asset ratio
1914	540	651396	76193	738044	610880	5.5	17.2
1915	542	738393	81303	832329	669631	12.0	19.5
1916	552	971842	90703	1086518	806966	26.7	25.7
1917	556	1267866	99452	1395331	980603	25.0	29.7
1918	564	1594746	109761	1741930	1268527	22.2	27.2

NOTE: The growth rates of total assets are computed as continuously compounded annual rates of growth. The liquid asset ratio is computed as total assets less loans as a percentage of total assets. The main liquid assets include cash, deposits in other banks, bonds and other securities. A small fraction of non-liquid items are comprised in the liquid asset ratio for data reasons, such as premises, furniture, money boxes etc, see text for further information.

2.6 Sources and notes

2.6.1 Newspaper sources

The following newspaper sources were examined, in most cases for all available years before 1861. The place of publication is given in parentheses in cases where it does not appear in the title.

- *Adressebladet* (Christiania)
- *Adressetidende for Brevig, Stathelle og Langesund*
- *Aftenbladet* (Christiania)
- *Bergensposten*
- *Bergens Stiftstidende*
- *Christianiaposten*
- *Christianssundsposten*
- *Correspondenten* (Skien)
- *Den Norske Rigstidende* (Christiania)
- *Drammens Tidende*
- *Hamars Budstikke*
- *Hedemarkens Amtstidende* (Hamar)
- *Holmestrandsposten*
- *Jarlsberg og Laurvigs Amtstidende*
- *Kongsberg Adresse*
- *Kragerø Adresse*
- *Landboe-Avisen* (Volda)
- *Lillehammer Tilskuer*
- *Lister og Mandals Amtstidende*
- *Morgenbladet* (Christiania)
- *Nordre Trondhjems Amtstidende* (Levanger)
- *Postbudet* (Volda)

- *Romsdals Amtstidende* (Christiansund)
- *Romsdals Budstikke* (Molde)
- *Tromsø Tidende/Stiftstidende*
- *Trondhjems Adresseavis*
- *Vestlandske Tidende* (Arendal)
- *Østerdølen* (Elverum)

2.6.2 List of anniversary publications before 1946

A reasonably complete bibliography of anniversary publications appearing after 1945 can be found in Knutsen and Lange (1992). In addition, some recent publications have included useful bibliographies of publications within their respective regions, see Gardåsen (1998), Lekve et al. (1998), Husby (1985), Nordvik et al. (1989), Reiersen (1998) and Sandberg (1995). See also the references in Rønning (1972).

The list below contains all anniversary publications published *before 1946* that were consulted in the present study. It covers many of the publications that have appeared, but it makes no claim of being complete. The name and the year of the publication is given, and, if stated, the name of the author. In many cases the publication is authored by the bank itself. The place of publication is nearly always the place where the main office of the bank is located.

- *Femtaarsberetning vedkommende Bergens Sparebank, stiftet 12te Februar 1823*, 1873.
- *Christiania Sparebank 1822–1897* (Evald Rygh), 1897.
- *Bamle Sparebank 1849–1899: Utarbeidet i Anledning af Bankens Femitaarsjubilæum den 11. December 1899*, 1899.
- *Stavanger Sparekasse 19 Oktober 1850–29 Oktober 1900*, 1900.
- *Tvedestrands Sparebank 15 August 1852–15 August 1902*, 1902.
- *Vangs Sparebank Hamar. Femtaarsberetning 1853–1903*, 1903.
- *Voldens og Ørstens Sparebank 1854–1904*, 1904.
- *Trondhjems Arbeiderforenings Spareskillingsbank 1854–1904* (J. Five), 1904.
- *Haugesunds Sparebank: Femtaarsberetning 1855–1905*, 1905.
- *Ørskog Sparebank 3. Januar 1857 til 3. Januar 1907* (P. Th. Gjære), 1906.

- *Kvinnherred Sparebank 26 November 1857–26 November 1907: Femtiaarsberetning* (Axel Lea), 1907.
- *Bodø Sparebank: Femtiaarsberetning 1858–1907*, 1908.

CHAPTER 3

A reconstruction of the balance sheets of commercial banks in Norway 1848–1900

Jan T. Klovland¹

The broad picture of the development of commercial banks in Norway towards 1900 is fairly well established, but we still lack fully satisfactory data on the annual movements the most important assets and liabilities of individual banks. Previous research has gone some way towards filling these gaps, but there still seem to be unexploited sources that can be used to make the data series more complete. The purpose of the present study is to make another effort in order to present more exact annual balance sheet data for the commercial banks before 1900. The items included are deposits, equity and loans. The major new sources include material deposited with the Regional State Archives in Trondheim and Stavanger and the University of Bergen; in addition, statements of annual accounts in local newspapers, trade journals and data series published in individual bank anniversary publications have been recovered.

¹Jan T. Klovland is professor at the Norwegian School of Economics and Business Administration in Bergen and special adviser to the Research Department of Norges Bank.

3.1 Introduction

The first commercial bank in Norway, Christiania Kreditkasse, was established in 1848. In the first years of its life the bank operated on a very moderate scale; after seven years, in 1855, its deposits were still only 25 percent of that of the largest savings bank in Norway, Christiania Sparebank.²

In the second half of the 1850s the development of commercial banking entered a new phase. The paid-up capital of Christiania Kreditkasse was increased significantly, and the amount of loans outstanding was increased by a factor of three between 1855 and 1860. Three other banks that were to play a dominant role throughout the century were established during the following years: Bergens Privatbank in 1856, Den norske Creditbank in 1857 and Privatbanken i Trondhjem in 1859.³ Although still being smaller than savings banks with respect to aggregate volumes of deposits and loans, commercial banking was firmly established by the early 1860s and came to play an increasing role as financial intermediaries in Norway until shortly after World War I.

The broad picture of the development of commercial banks in Norway towards 1900 is fairly well established, but we still lack fully satisfactory data on the annual movements of the most important assets and liabilities. Until recently there were large gaps in the information on the annual balances of individual banks. However, a useful study published by Matre (1992) has gone a considerable way towards filling these gaps, although there still seem to be unexploited sources that can be used to make the data series more complete. The purpose of the present study is to make another effort in order to present more exact annual balance sheet data for the commercial banks before 1900. The items included are deposits, equity and loans.

The reconstruction of balance sheet items of individual banks is a difficult task for various reasons. In 1877 Statistics Norway began publishing annual data on selected items of the main commercial banks, but a number of small banks were not included in the period 1877 to 1900.⁴ The data on deposits and equity of the banks which are included in the statistics are reliable, but the loan series cover only bills, which did not account for more than roughly two thirds of total loans. In earlier years data on commercial banks were presumably not systematically collected by the authorities, at least they cannot be found in available sources.⁵

In the early years many commercial banks published their annual balances in newspapers. From the 1870s a more restrictive practice with respect to public announcements seemed to develop, however. In some cases the local newspaper noted that the annual shareholders' meeting had taken place, perhaps also giving some information on profits and dividends and sundry other items, but

²The bank was renamed to *Christiania Bank og Kreditkasse* in 1862. The first hundred years of the history of the bank are covered in Engebretsen (1948).

³Den norske Creditbank began its operations on 1 October 1857, but the first annual accounts were not published until 1858, see Hertzberg and Rygg (1907).

⁴The data can be found in *Statistical Yearbook of Norway* and *Meddelelser fra Det Statistisk Centralbureau*. The number of banks included were increased in 1889.

⁵In *NOS Statistiske Oversikter 1948* aggregate figures on paid-up capital, reserve and contingency funds as well as loans (portfolio of bills) can be found. These are reasonably complete, but some minor banks are apparently not included in the aggregates. Note that there are no data on deposits and that the loan series comprises bills only.

falling short of publishing the whole balance sheet.⁶

Although such a reconstruction project thus meets with numerous difficulties, we have succeeded in collecting significant new information on the balance sheets of commercial banks that previously have been left in the dark. The major new sources include material deposited with the Regional State Archives in Trondheim and Stavanger and the University of Bergen; in addition, statements of annual accounts in local newspapers, trade journals and data series buried in individual bank anniversary publications have been recovered.

The banks included here are those which were organized as a limited company with a share capital and (in principle) paying dividends to its shareholders. These include a few examples of banks which formally adopted the name of 'sparebank' (savings bank). In some cases these were erroneously classified as savings banks in the official statistics (see appendix for further details). In practice their business was probably very similar to that of a local savings bank, but their ownership structure was clearly that of a commercial bank as defined here.⁷

The distinction between a commercial bank and other financial intermediaries is therefore not always wholly clear-cut. In principle we only include those banks which performed regular banking business including discounting bills. Before 1856 some of the lending activity of Christiania Kreditkasse was in the form of advances against commodity stocks and securities as collateral, but it also discounted regular trade bills, which became the dominant type of loan business.

Drammens Kreditkasse was founded in 1849 on much the same basis as the bank in Christiania. According to Eier (1954, p. 46) Drammens Kreditkasse began discounting bills in 1852, but in contrast to Christiania Kreditkasse, the discount business seems to have played a minor role before the 1860s. In 1867 the bank was reconstructed along the principles of an ordinary commercial bank and established as Drammens Privatbank. Although Drammens Kreditkasse is claimed to be the 'second oldest' commercial bank in Norway,⁸ little is known about the scale of its activities in the early years, except that it was fairly small.⁹ Balance sheet data for Drammens Kreditkasse are included here for the years 1863–1866 only, because no information is available for earlier years. However, this bank is included in the number of banks in operation as from its founding year, 1849.

In addition to the banks listed here there were probably several small-scale commercial banks on which we have no or only fragmentary evidence. The criterion used here is that data for at least one year of the bank's history must be known. Some of the neglected banks may be classified as 'ephemeral' banks, but in other cases they may have been in operation for a considerable time period on a very small scale, serving the local community. Brandal (1989) lists no less than four commercial

⁶For one particular example see *Vestlandske Tidende*, the local newspaper in Arendal, for 26 March 1876 concerning the first annual balance of accounts of Arendal Privatbank. Only profits and dividends were reported.

⁷There is also an example of a savings bank adopting the name of *Privatbank* (private bank). Strandvik Privatbank was founded in 1868 and was amalgamated with Fusa Sparebank in 1883. It seems that this bank corresponds most closely to a savings bank, see Fusa Sparebank (1958). See also *Amtmannsberetninger 1866–1870*, section M, Søndre Bergenhus Amt, p. 15.

⁸Eier (1954, p. 44).

⁹See Hoffstad (1928, pp. 322–326), Drammens Privatbank (1917) and Eier (1954, pp. 37–50) on the kind of business that characterized Drammens Kreditkasse.

banks in existence in the 1850s in the small region of Ryfylke.¹⁰ Although their exclusion hardly affects the aggregate figures on deposits, equity and loans, this piece of information makes it clear that the number of commercial banks reported here definitely falls short of the actual number of banks in operation.

3.2 Sources of balance sheet data for commercial banks before 1900

3.2.1 Data on individual commercial banks' accounts published by Statistics Norway

There is no complete statistics of commercial banks until 1900 when Statistics Norway began publishing detailed information on the balance sheet items of nearly all commercial banks.¹¹ However, beginning in 1877 Statistics Norway published annual information on deposits, equity and certain types of loans for the major banks.¹² These data cover only selected items of the balance sheets. Data on deposits and equity for the banks which are included in the statistics seem to be complete and consistently reported, but the information on loans include the portfolio of bills only.¹³ For some banks other types of advances were of even greater importance, in particular current drawing accounts and other unsecured loans on which there is no information, except in 1877 and 1878. Mortgage loans were not included either, but the amount outstanding was rather small in the case of commercial banks.

The sample of banks included was extended to cover some small banks in 1889, which increased the number of banks from 19 in 1888 to 31 in 1889. The increase in the number of banks figuring in the returns of 1889 is deceptive, as none of the newly included banks were in fact established in 1889. This is but one of several pitfalls users of commercial bank statistics is faced with.

3.2.2 Previous attempts at reconstructing the balance sheet items of commercial banks

Matre (1992) presented a very useful attempt at collecting figures on deposits and various types of loans for all commercial banks in the period before 1900. This effort represents a significant improvement over the existing data provided by Statistics Norway. Much new information was obtained from annual statements of accounts of individual banks and anniversary publications. Still, a considerable

¹⁰These were Hjelmeland Spareskillingsbank, Rennesøy Spareskillingsbank, Sand Sparekasse and Stjernarøy Sparebank, which according to Brandal (1989) were organized as commercial banks rather than savings banks despite their names. See the notes on these banks in the appendix.

¹¹NOS *Private Aktiebanker*.

¹²The commercial bank returns can be found in annual issues of *Statistical Yearbook of Norway* and in *Statistiske Meddelelser*. Data for 1884 can only be found in the latter source.

¹³Foreign bills seem to have been included in the bill portfolio in some cases, but mostly this item was not added to the figures.

number of gaps remained, even for some of the large and medium-sized banks in the 1860s and 1870s, in which cases linearly interpolated estimates were substituted for actual balance sheet figures. However, the estimates of aggregate figures on deposits and loans of the commercial banks are probably much closer to the true ones than the previous data collected by Statistics Norway.

3.2.3 The new sources of data

The present study draws heavily on the individual balance sheet data presented in Matre (1992). A further improvement of the data base has enabled us to fill some of the gaps concerning the larger banks in the early years. The most important additions are as follows. The State Archive of Trondheim contained a complete run of the annual accounts of Privatbanken i Trondhjem (established in 1859) and Nordenfjeldske Kreditbank (1868), on which data previously had been very incomplete.¹⁴ The State Archive of Stavanger contained a complete collection of annual statements of the ill-fated Stavanger Kreditbank (1865–1887) and of Stavanger Privatbank (established 1879).¹⁵ It also turned out that a set of annual statement of accounts for Bergens Privatbank is held by the University of Bergen. This represents a significant contribution because the available evidence on this important bank, the second largest in 1870, had been rather patchy before the early 1880s. Another relatively large bank, Bergens Kreditbank, was established in 1876 by transferring the assets and liabilities of the Bergen office of Christiania Bank og Kreditkasse to a new bank; its annual statement of accounts were found in the newspaper *Bergens Tidende* in the first years of its existence before 1882.

Numerous minor corrections and additions to the existing data base in Matre (1992) were made by drawing on information in local newspapers, anniversary publications and the commercial bank statistics.¹⁶ As explained above, many commercial banks adhered to a restrictive practice with respect to publishing their annual statements of account after the 1860s. An extensive search in various local newspapers in the 1860s and 1870s resulted in some pieces of new balance sheet information, but in general the full annual accounts of the commercial banks were not to be found. There are consequently some remaining figures that need to be interpolated in the cases of a number of medium-sized banks established in the 1870s, the most important of which are Tønsberg Privatbank, established 1870,¹⁷ and Arendals Privatbank,¹⁸ Kristiansund Kreditbank, and Drammens og Oplands Kreditbank, which all opened for business in 1875.

¹⁴We are indebted to Kari Helgesen for making this material available to us.

¹⁵Stavanger Kreditbank was the second of the important banks to fail in the deflationary environment of the 1880s, in February 1889; Arendals Privatbank failed in October 1886.

¹⁶The annual returns collected by Statistics Norway were published in some more detail in *Statistiske Meddelelser* than in the *Statistical Yearbook*, primarily by including the previous year's figures of some items. This was valuable in cases where banks were entered into the statistics after some years of business. Also, data for 1884 are missing for many banks in the tables in Matre (1992). This may be due to the fact that 1884 figures were not published in *Statistical Yearbook*, but only in *Statistiske Meddelelser*.

¹⁷Data on total assets, deposits and equity of Tønsberg Privatbank were printed in the bank's fifty years anniversary report, see Tønsberg Privatbank (1920). Loan figures for the year 1872 were found in the newspaper *Tunsbergeren* of 4 April 1873. For the remaining years from 1870 to 1876 loans were interpolated using data on total assets in the source noted above.

¹⁸The annual accounts of Arendals Privatbank in 1884 and 1885, the last two years before it failed, can be found in Blichfeldt (1887).

3.3 The balance sheet items

We include data on three balance sheet items: deposits, equity and loans, which are defined in more detail below. These items are the only ones on which information is given in Commercial bank statistics published by Statistics Norway before 1900. For some of the major banks, for which a complete run of annual accounts have been preserved, it would have been possible to reconstruct other items such as balances due to and from other domestic and foreign banks as well as their portfolios of securities. In the majority of cases, however, such information is missing. It may also be noted that the way the accounts were set up varied quite much across the banks, which presents problems regarding a more detailed tabulation of balance sheet items. In the early years some banks presented a mixture of flows and stock information in their ‘general balances’, which presents further complications.¹⁹

3.3.1 Deposits

This item includes demand deposits (*kassefolie*), time (or term) deposits with a fixed maturity (*bestemt tid*) and savings deposits (*sparebankvilkår; oppsigelse*). The savings deposits were formally subject to a notice of withdrawal at one, three or six months time, but a liberal practice with respect to waiving these rules seems to have developed over time.²⁰

In the early years, say before the 1870s, term deposits with a fixed maturity were of some importance. From this time on, however, savings deposits at 3 and 6 months’ notice came to dominate as the main deposit instrument.²¹ The share of demand deposits was quite small and decreasing over the period to 1900. In a sample of ten leading commercial banks, for which data are available, demand deposits equalled 14.4 per cent of total commercial bank deposits in 1860, falling to 8.9 per cent in 1870, increasing slightly to 9.5 in 1880, but then falling further to 5.5 per cent in 1890 and 6.0 per cent in 1900.²² Total demand deposits were also small relative to the currency circulation, amounting to 11.8 per cent in 1900. Consequently, for this period a M1 definition of money, including only currency held by the public and demand deposits, is dominated by currency. The relevant monetary aggregate in this period is clearly a broader M2 definition, including all deposits. Savings deposits

¹⁹For example, in the balances of Bergens Privatbank the annual turnover of demand deposits and discounted bills were added to the stocks of other items. This practice was discontinued after 1879. In general, due to heterogeneous accounting standards and incomplete information time series of the commercial banks’ total assets are not particularly informative before 1900. For an attempt at presenting some data on this, see Matre (1992).

²⁰See for example the comments in the weekly financial paper *Farmand* of 2 May 1891. The rule was more strictly adhered to in special circumstances, as for example during the outbreak of World War I, see Rygg (1954, p. 359).

²¹The distribution of deposits in Den norske Creditbank can be found in Hertzberg and Rygg (1907, p. 158). These data show that fixed term deposits were larger than savings deposits in 1858, but that the latter category became dominant in the 1860s. A similar tendency can be observed in the balances of Bergens Privatbank; initially fixed term deposits were largest, but savings deposits gradually increased their share, particularly from the mid 1870s. See also Hoffstad (1928, pp. 115–118).

²²The banks included in the sample are Christiania Bank og Kreditkasse, Bergens Privatbank, Den norske Creditbank, Privatbanken i Trondhjem, Stavanger Kreditbank, Drammens Privatbank, Nordenfjeldske Kreditbank, Bergens Kreditbank, Stavanger Privatbank and Skienfjordens Kreditbank. For all commercial banks the share of demand deposits in 1900 was 6.1 per cent.

was practically the only deposit category in savings banks until after the turn of the century, when demand deposits were introduced in some of the large savings banks.

Only deposits from non-banks should be included in these figures, but according to the foreword of the commercial banks statistics in 1907 it might also be the case that interbank deposits were included to some extent.²³ In 1907 it was estimated that for commercial and savings banks in total the maximum amount that could have been included as interbank deposits equalled 3.7 per cent of total deposits. On the other hand, there is some evidence that a fraction of the amounts entered as 'sundry creditors' (*diverse kreditorer*) really should have been classified as deposits.²⁴ Due to lack of any specific information, no correction has been made for these items, which may have been of approximately the same order of magnitude and thus counterbalanced each other.

The deposit figures includes deposits held by the Treasury and state banks. This item is mostly rather small, in the order of 2 to 3 per cent, but during certain periods, as in the years 1872 to 1877 and from 1897 to 1900, it could amount to more than five per cent of total commercial bank deposits.²⁵

3.3.2 Equity

Equity, as defined here, comprises the amount of paid-up share capital and all funds except pension funds. Except for some of the minor banks, data on this item are fairly complete.

3.3.3 Loans

Loans include in principle all kinds of loans and advances to the non-bank public: domestic and foreign bills, mortgage loans and various types of advances. In the first part of the period bills, either ordinary trade bills (*veksel*), or a particular kind of renewable bills (*vekselobligasjon*), were the dominant type of loans. Domestic bills accounted for the bulk of the bill portfolio (96.5 per cent in 1900), but many banks also discounted some foreign bills.

As mentioned above, only bills were reported in the annual commercial bank returns prior to 1900. Data on this loan type are therefore much more complete and accurate than the remainder of loans offered by the commercial banks. Various types of advances, with no or unspecified collateral, also played an important role. In later years these were mostly associated with current drawing accounts (*kassekreditt*), or were simply entered under the item of 'sundry debtors' (*diverse debitorer*). In 1900, the first year for which complete data exist, these loans constituted 36.4 per cent of total loans.²⁶

The amount of mortgage loans was not particularly important in commercial banks, accounting for 11.6 per cent of total loans in 1900. The bulk of mortgage loans (84 per cent in 1900) originated

²³Private Aktiebanker 1907, Statistics Norway, p. 5.

²⁴When the commercial bank statistics was revised in 1925 it was discovered that about 20 per cent of demand deposits previously had been classified as sundry creditors.

²⁵Quarterly estimates of domestic bank deposits due to the Treasury and state banks can be found in Klovland (1984).

²⁶Matre (1992) contains separate estimates of the various loan types for individual banks, but in many cases loan figures for other categories than bills had to be based on interpolations.

from two banks which specialized in offering such loans to the public, Kristiania Hypothek- og Realkreditbank and Trondhjems Realkreditbank. These banks also offered other types of loans, but the greater part of their portfolios consisted of mortgage loans, part of which were financed by the banks' own deposit funds and, after the restriction on the emission of bonds had been lifted in 1898, by selling bonds on the domestic market. However, a substantial part of the mortgage loans on their balances were due to the fact that the two banks acted as pure intermediaries of privately placed mortgage loans.²⁷

For some medium-sized and small banks the estimates of other loans than bills represent problems – in some cases the amount of such loans are known only for selected years, or, in the worst case, only for the year 1900. In such cases the amounts were estimated using information on the share of such loans in benchmark years and rough estimates of the size of the bank. Although this procedure had to be applied to a number of small banks, this source of uncertainty does not materially affect aggregate bank loan figures. In 1870 about 2.5 per cent of total loans are based on estimates rather than actual balance sheet information, increasing to 3.5 per cent in 1885 .

3.4 New estimates of the balance sheets of individual commercial banks 1848–1918

3.4.1 Balance sheet items

Table 3.A.1 of the appendix contains data on deposits, equity and loans for individual commercial banks derived from the principles explained above. In cases where significant amounts of any item had to be estimated or interpolated in want of exact balance sheet information the figures are given in blue colour.

Table 3.1 contains the revised estimates for all commercial banks. Revised figures for the years 1901 to 1918 are also included. The figures after 1899 are based on the annual bank statistics published by Statistics Norway,²⁸ but a number of corrections and additions have been made to these data. For the period from 1900 to 1918 there are 25 cases where existing banks were not included in the published statistics, most of which concern newly established banks that were not included in the first year(s) of business. Information on these banks could often be extended one year back in time by using available data on the opening balances from the published statistics.²⁹ There are also some cases where existing banks, which were left out of the published statistics for a longer period, have been included here; the most important ones are Trondhjem Handels- og Industribank (1900–1902), Levanger Haandverkerforenings Sparekasse (1900–1908), Røkens Sparebank (1900–1906),

²⁷As a consequence, it will be seen from an inspection of the annual accounts of Kristiania Hypothek- og Realkreditbank and Trondhjems Realkreditbank that there was a large mismatch between the amounts of loans and the much smaller amounts due to depositors. See Keilhau (1936) and Hoffstad (1928) for an account of the two banks and their activities.

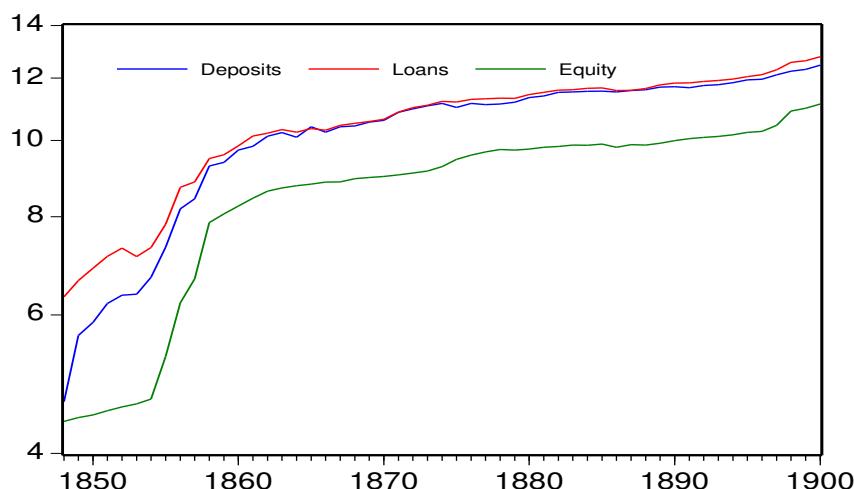

²⁸Annual issues of *Private Aktiebanker* beginning in 1900.

²⁹These banks were all very small except one, the old private banking business of Andresens Bank, which was formally established as a commercial bank in 1913.

and Lillestrøm Sparebank (1900–1908). The reason why the last three banks were not included earlier is that they were initially believed to be savings banks, but later it was ‘discovered’ that they were ordinary commercial banks.³⁰

Figure 3.1 shows the new estimates of the commercial banks’ balance sheet items for the period 1848 - 1900, using a logarithmic scale. After a period of very high growth in the initial founding years in the 1850s the trend growth rate of deposits settled down to about 9 per cent in the 1860s and slightly above 7 per cent per year in the 1870s. The rates of expansion of deposits and loans were further reduced after 1882, but from 1897 some years of rapid growth followed. These years are also marked by an unusual strong growth in commercial bank equity.

FIGURE 3.1 Deposits, equity and loans of commercial banks. 1848–1900. Logarithmic scale

A more detailed view of the cyclical behaviour of deposits and loans can be inferred from Figure 3.2, which shows annual growth rates from 1860 onwards. The middle of the 1860s were characterized by volatile movements, with significant contractions in commercial bank assets and liabilities in 1864 and 1866.³¹ After this there are three periods of rapid expansion in commercial banking: 1867–1874, 1879–1882, and 1897–1900, which roughly coincide with periods of expansion in economic activity in Norway.³² The commercial bank failures in 1885 to 1887 occurred within a period of very slow growth from 1883 to 1888; the worst year was 1886 when aggregate deposits fell 2.5 per cent and loans fell by 10.1 per cent.

³⁰See the forewords to the Commercial Bank Statistics (*Private aktiebanker*) of 1907 and 1909.

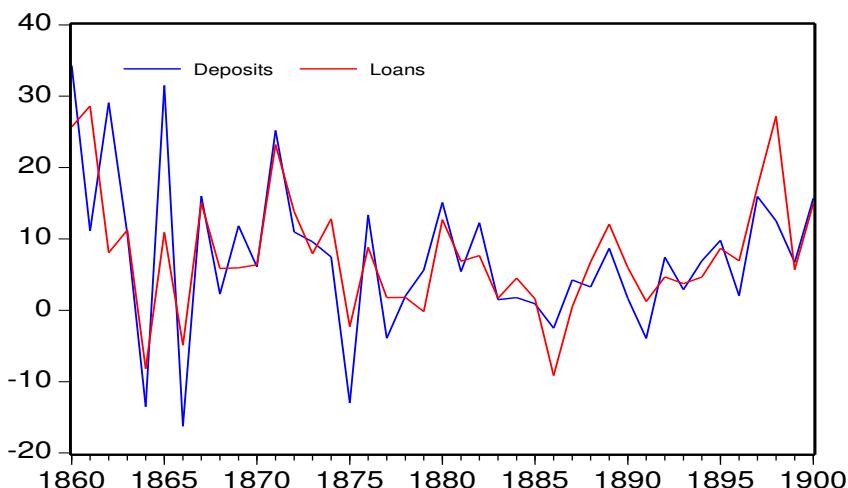

³¹The crisis of the mid 1860s was most severely felt by Den norske Creditbank, which experienced heavy losses on loans used for property investments, see Hertzberg and Rygg (1907, pp. 89–111). It can be seen from Table ?? of the appendix that the loan portfolio of Den norske Creditbank fell by 42 per cent from 1863 to 1866.

³²See Klovland (1989) for a tentative business cycle chronology for Norway covering this period.

The new aggregate time series of deposits and loans generally follow the same pattern over time as the commercial bank estimates of deposits and loans derived by Matre (1992), but there are some interesting new features. For both deposits and loans the data series show approximately the same level in 1868 and 1882. However, in the new series more of the expansion in commercial bank activity in this period is shifted forward to the years from 1870 to 1873, which were a period of strong economic activity.³³ Our data also show a much sharper decline in the years 1875 and 1877.

The spectacular growth in commercial bank activity in Christiania in the latter part of the 1890s

FIGURE 3.2 Annual growth rates of deposits and loans of commercial banks. 1860–1900. Per cent

and the subsequent failure of many of the newly established banks in the years after 1898 is a well known episode that has attracted much attention, particularly because it has been seen as one of the key factors creating the house price boom and bust at that time.³⁴ The available information on the full extent of the growth in loans from some of the fast-growing ‘ephemeral’ banks has been somewhat incomplete, but more balance sheet information has now been recovered.³⁵ The present study has resulted in a somewhat higher growth rate of bank loans in the years from 1895 to 1897 and a significant upward revision for 1898, with a corresponding slower growth in the following two years.³⁶

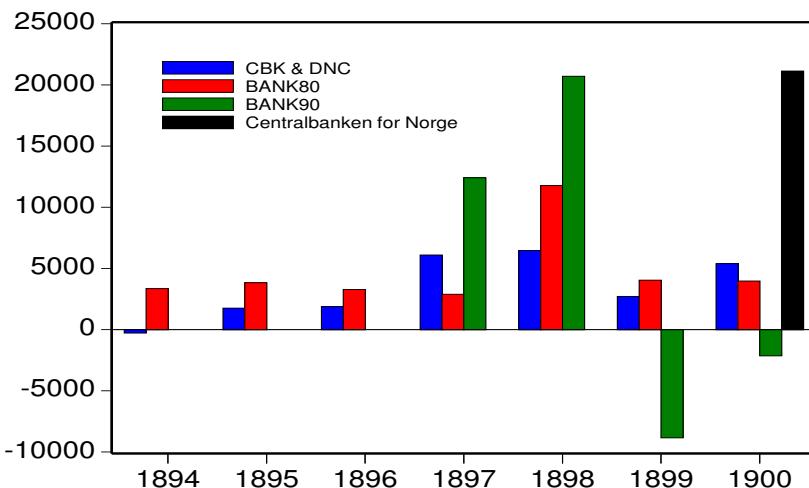

³³The new data imply that commercial bank deposits expanded 51.9 per cent (continuously compounded rates) over the four years from 1870 to 1873; the estimates in Matre (1992) imply a growth of 40.8 per cent.

³⁴For a general background see, *inter alia*, Hoffstad (1928, pp. 154–192) and Rygg (1950, pp. 238–268). The links between commercial bank growth and house prices have been discussed by Gerdrup (2003, 2004).

³⁵Most importantly, the balance sheets of Den norske Industri- og Vexelbank and Den norske Discontobank were located in the Christiania newspapers *Norske Intelligenszedler* and *Morgenbladet*. From the published accounts it is in some cases not possible to separate balances due from other banks from loans to the non-bank public; hence, some of the figures for loans may be somewhat too high.

³⁶According to our new estimates aggregate bank loans expanded at an annual rate of 27.2 per cent in 1898; the correspond-

FIGURE 3.3 Annual growth of loans in Christiania banks. 1894–1900. 1000 kroner.

The unusual development of commercial banking activity in Christiania in the 1890s is illustrated in Figure 3.3, which shows the annual growth of loans originating from four groups of banks in the years 1894 to 1900: (1) the two large commercial banks Christiania Bank og Kreditkasse and Den norske Creditbank, which were established in the 1850s; (2) BANK80 – four banks established in the 1880s, the most important of which was Kristiania Hypothek- og Realkreditbank, which was heavily engaged in the intermediation of mortgage loans³⁷; (3) BANK90 – seven banks established in the years 1897 to 1899³⁸; (4) Centralbanken for Norge, established in 1900. From the graph it will be seen how the newly established banks came to dominate the lending activity in the years 1897 and 1898; in the latter year, Kristiania Hypotek- og Realkreditbank also expanded considerably due to the fact that from 1898 it was able to raise a considerable amount of funds by issuing bearer bonds. By contrast, the loan expansion from the well established, large banks was modest throughout the latter half of the 1890s. In 1899 the banking business of the new banks began to collapse. With the establishment of Centralbanken for Norge in 1900, commercial bank activity in Christiania entered into a new phase, once again dominated by the growth of large banks.

ing figure computed on the basis of data in Matre (1992) is 21.5 per cent. The timing of the expansion period may be crucial with reference to the house price boom, which peaked in 1899 according to Eitrheim and Erlandsen (2004).

³⁷The three other banks were Christiania Handelsbank, Kristiania Folkebank and Krisitania Arbeiderbank.

³⁸Den norske Industri- og Vexelbank, Den norske Discontobank, Christiania Privatbank, Norsk Vexel- og Landmandsbank, Kristiania Delkrederebank, Totalisternes Aktiebank and Den nordiske Aktiebank. All these banks failed in the period 1898 to 1904, except the tiny Totalisternes Aktiebank, which was renamed to Christiania Ørebanks in 1902.

3.4.2 The number of banks

The new data collected in Table 3.1 also imply a slight revision to the number of commercial banks in operation in comparison with the figures in Matre (1992). Our sample includes various minor banks that were not reported in that source.³⁹ Beginning in 1884 we also report figures for Levanger Haandværkerforenings Sparekasse, which had changed its status from being a savings bank to a commercial bank.⁴⁰ Lillestrøm Sparebank, which was established in 1887, had a rather unclear status; although it may initially have been intended as a savings bank (it was founded through a public subscription of share capital), it was never authorized as such and gradually developed into a normal commercial bank.⁴¹

The number of banks is sometimes used as an indicator of the development of banking and of the degree of financial sophistication in general.⁴² There are various reasons why this measure is a rather poor indicator in the case of nineteenth century Norway. The size of some banks that were formally organized as commercial banks was extremely small. These banks operated within a restricted local community – and we know that there may have been a significant number of other small, ephemeral banks, for which no data have survived.⁴³ The business conducted by small locally oriented commercial banks in rural areas was much closer to that of a typical savings bank than to a commercial bank located in a town. Furthermore, several of the large commercial banks established branch offices in other towns, which were in some cases continued as independent banks at a later stage.⁴⁴ Some of these branch banks were relatively important and operated with considerable independence of the mother bank. This presents a further dilution of the concept of the ‘number of banks’. The amount of capital invested in commercial banking, represented by our new series of equity, is probably better suited as an indicator of the development of commercial banking. Table 3.1 gives the aggregate figures of commercial bank equity from 1848 to 1918.

³⁹Before 1883 these are Røkens Sparebank, Trondhjems Handelsbank (founded in 1865 as Detaljistforeningens Sparebank, which changed its name to Trondhjems Handelsbank in 1885) and Kvam Privatbank. Further details on these three banks can be found in Slåtto (1957), Helgesen (2000, p. 80) and Kolltveit (1962). Note also that Drammens Kreditkasse (see section 3.1 above) is contained in the estimates of the number of banks in operation right from its founding in 1849 although we have no balance sheet data relating to this bank until 1863.

⁴⁰See Privatbanken i Levanger (1920).

⁴¹See Tveter (1937). It was taken up in the commercial bank statistics in 1906, but our data begin with 1887, the first year in which the bank was in operation. In 1924 it was reestablished as a savings bank.

⁴²For Norway see for example Eitheim et al. (2004), where the number of commercial and savings banks were tabulated annually for the whole period from 1822 up to 2003. The revised data series presented here and in the previous chapter on savings bank deviate slightly from the figures presented there due to corrections and some new information.

⁴³See the reference to the largely unknown small commercial banks in Brandal (1989) discussed above in section 3.1.

⁴⁴Bergens Kreditbank was established in 1876 as a continuation of the branch office of Christiania Bank og Kreditkasse, which had been founded in 1859, see Engebretsen (1948, pp. 94–96).

List of commercial banks which changed their names or status

- Christiania Bank og Kreditkasse. The name was changed from Christiania Kreditkasse in 1862.
- Drammens Kreditkasse. Reestablished as Drammens Privatbank in 1867.
- Trondhjems Handelsbank. Established as a commercial bank under the name of Detaljistforeningens Sparebank in 1865, reconstructed under the new name in 1885, merged with Den Borgerlige Forenings Sparebank, Trondhjem in 1909. The latter bank was established as a commercial bank in 1868.
- Trondhjems Realkreditbank. Established in 1874 as Trondhjems Hypothekforsikringsselskap, changed its name in 1892.
- Kvam Privatbank. Established under the name of Østensø Laaneindretning in 1862, reconstructed under the new name in 1882.
- Den norske Discontobank. Established in 1897 as Kommanditaktieselskabet Arntzen, Schmidt & Co., which began their operations in January 1898. Renamed to Den norske Discontobank early in 1899, but went into liquidation later in the same year.
- Trondjems Haandværkerforenings Sparekasse. Established as a savings bank in 1848, converted to a commercial bank in 1877. Renamed as Trondhjems Haandverk- og Industribank in 1907.

- Levanger Haandværkerforenings Sparekasse. Established as a savings bank in 1880, changed its status to a commercial bank in 1884, renamed as Privatbanken i Levanger in 1912.
- Totalisternes Aktiebank. Established 1898, changed its name to Christiania Ørebanks in 1902.

3.4.3 List of commercial bank which failed or went out of business

- Arendals Privatbank failed in September 1886.
- Stavanger Kreditbank failed in February 1889. No accounts were published for 1888.
- Aardals Privatbank (Ryfylke) went out of business in 1897.
- Sarpsborg og Omegns Privatbank ceased operations in 1898.
- Den norske Discontobank was forced into liquidation from 1899. Balance sheet data for 1899 are not included here.
- Den nordiske Aktiebank was established in 1899 but was liquidated with a guarantee from four other banks in the summer of the same year. Incomplete balance sheet data for 1899 have been included here.

List of commercial bank in operation before 1900 on which there is no balance sheet information

The list contains information on the period in which the banks were in operation and a reference to sources giving such information. The annual commercial bank statistics published by Statistics Norway, *Private Aktiebanker*, is referred to as *CBS* (year). The banks referred to below are not included in the number of banks in operation as estimated here because the information is less specific as to these banks.

- Hjelmeland Spareskillingsbank (1852–ca. 1927). Brandal (1989).
- Rennsø Spareskillingsbank (1854–ca. 1927). Brandal (1989). This bank may initially have operated as a savings bank and is included among the savings banks through 1881 (see Chapter 2 of this volume). It was entered into the Norwegian Registry of Firms (Handelsregisteret) as Rennesø Spareskillingsbank in February 1875 (published in *Den Norske Rigstidende* 5 April 1875). The bank then seemed to be organized as a general partnership. It was reported in *CBS* (1909, p. 2*) that Rennesøbanken was registered as a company with limited liability in 1910, but no balance sheet data were reported in *CBS* until 1918, when Rennesøbanken, established 1854, appears in the tables.
- Sand Sparekasse (1855–1880s). Brandal (1989).

- Stjernarøy Sparebank (1859–). Brandal (1989)
- Jelsa Sparebank (1865–1896). Renamed to Jelsa Privatbank in 1897, which is included here. Brandal (1989).
- Vats Privatbank (1867–). This bank is included in *CBS* (1909) for the first time, where it is noted that this bank was founded in 1867 and was previously called Vats Sparebank. It is most likely that it was a commercial bank right from its foundation as it was never referred to in the savings bank statistics.
- Aardal Spareskillingsbank (1878–1902). Brandal (1989).

CHAPTER 4

Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices

Ola H. Grytten¹

Professor Dr. Ingvar B. Wedervang was genuinely interested in economic history as a tool of understanding the present economic situation and forecast the future. In consequence, an archive on historical prices and wages was set up along with the Institute of Economics at the University of Oslo in 1932. With generous funding, Wedervang and his assistants searched through private and public records in their efforts of establishing the best possible coverage of historical data of wages and prices for Norway. The archive, now located at the Norwegian School of Economics and Business Administration in Bergen, now stands as one of the world's largest manual archives of wages and prices. A number of historical price and wage series were calculated on the basis of the archive through several projects since the 1970s. Still, the Wedervang Archive has been under-utilized, until recently when it was revived during the Norges Bank project on Historical Monetary Statistics.

¹Ola H. Grytten is professor in economic history at the Department of Economics, Norwegian School of Economics and Business Administration, and special adviser to the Research Department of Norges Bank.

4.1 One of the world's richest archives on historical wages and prices

The data which are presented in this project on Historical Monetary Statistics for Norway rely on data from several sources and archives. However, one archive has served as a predominant source in order to extract and calculate the time series for gross domestic product, the consumer price index and wages. This is Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices, or Professor Dr. Ingvar B. Wedervang's lønns- og prishistoriske arkiv, as it is called in Norwegian. The archive is located at the Norwegian School of Economics and Business Administration in Bergen, Norway.

The Wedervang Archive holds a seven digit number of direct observations of prices, starting in 1641 and ending in 1940, and equally many observations of wages, starting in 1751 ending in 1939. These price and wage data reflect some two digit million observations. Thus, the archive, which is still manually recorded, is one of the richest of its kind internationally. It has its own history connected to Wedervang himself and to the staff working with its' files.

4.2 Professor Dr. Ingvar B. Wedervang (1891–1961)

Wedervang was born in Oslo on 21 June 1891. In 1913 he completed his degree in political economics, followed by a two-year position as secretary at Statistics Norway. He was employed as a statistician for Treschow-Fritzøe in the town of Larvik (eastern Norway) 1916–1918, and was head of department at the national Rationing Directorate 1918–1920. This job was followed by employment as counselor for to the National Price Regulation Office 1920–1923. In 1922 he took a leave to visit Munich with his family and work on his doctoral thesis *On the ratio of genders at birth*.² Along with working on his doctorate degree he was working for Statistics Norway again in 1923 and 1924.³

He submitted his thesis in 1924, which was successfully defended the year after, when he was also appointed reader in statistics at the University of Oslo. In 1927, at the age of 36, he was appointed professor of political economics and statistics, and became editor of the *Review of Political Economics*.⁴ He retained his professorship until 1936.⁵ Wedervang published a number of important works as author or co-author, such as *The National Income of Norway* (1926), *On the Use of Income and particularly on Saving* (1927) and *The World Economy in the Post-War Period* (1932).⁶ The latter publication was a joint work with two other senior academic economists at the time, Wilhelm Keilhau and Ragnar Frisch.

In 1930 Wedervang traveled to the US, and visited he universities of Columbia, Yale, Harvard

²Wedervang 1924.

and Chicago. He also wrote a proposal for the restructuring of the Norwegian economics study program. On his return to Norway, together with Professor Ragnar Frisch, he started to reorganize and modernize the program in economics at the University of Oslo in order to make it compatible with the academic standards he saw in America, in line with his previous proposal.⁷

Frisch and Wedervang were also granted a substantial amount of money from the Rockefeller Foundation in order to establish an Institute of Economics at the University of Oslo. This funding was supplemented by a grant from the Norwegian Fund for War Risks Insurance (Norsk vareforsikringsfond) and later from several other sources.⁸ The institute was founded on January 1 1932 with Wedervang and Frisch in a joint leadership.

Under the leadership of Wedervang the institute examined Norwegian retail trade, and during the first half of the 1930s it was a source of several publications on terms of trade and costs of different sub-industries within the trade sector. Perhaps more important, the institute compiled data on prices and wages in order to be able to examine the patterns and explanations of short- and long-term business cycles in Norway in the nineteenth and twentieth century.⁹ In 1936 this research project and its' data compilation task was incorporated into a more general program aiming at analyzing the Norwegian economic structure. This project was led by a steering committee, where three of the most prominent Norwegian professors in economics took part, notably Wilhelm Keilhau, Ragnar Frisch and Ingvar Wedervang. Four different departments were set up to work on this huge task. One department was set up under the leadership of Wedervang, working on the price and wage historical data, one under Keilhau and one under Arne Skau, whereas Frisch had the responsibility of coordinating the process, working on technical aspects like econometrics and the formation of national accounting.¹⁰ The outbreak of World War II, however, prevented the completion of the Norwegian economic structure project. Nevertheless, the data on wages and prices collected by Wedervang and his staff remained intact.

4.3 Wedervang and the Norwegian School of Economics and Business Administration

In 1937 Wedervang moved to Bergen to take up a position as rector and professor of economics at the newly founded Norwegian School of Economics and Business Administration (NHH). Originally this move was seen as temporary. He was granted a three-years leave from his work in Oslo in order to help with the establishment of a high academic standard at NHH. However, on April 9 1940 Norway was attacked by Germany and surrendered after two months of battle. Wedervangs leave from the chair in Oslo was extended as he wanted to continue his work on establishing an academically sound

⁷Wedervang 1930.

¹⁰Coward 1962, 284–285.

institution within trade, commerce and economics at NHH.¹¹ The bulk of the material in the price and wage archive was sent to Bergen in 1941.¹² Wedervang refused to cooperate with the German occupants and a police order was issued forbidding him to stay in Bergen. Thus, he returned to his post in Oslo, but was shortly after arrested during the German raid against the University in the autumn 1943. He was later kept at the Berg prison camp.¹³

After his release he spent his time during the remaining war-years maintaining contact with academics and preparing possible solutions to the economic problems connected to the coming liberation. At the end of the war he was heavily engaged in the plans for the post-war reconstruction in Norway. He took part in numerous important working committees and in 1946 he became the chairman of the national currency committee. He was also a prominent member of a group of specialists who worked out a settlement between the government and national ship-owners when the state-controlled wartime ship-owner company *NORTRASHIP* was dismantled after the war. Wedervang was also a prominent member of the commission investigating the wartime work of the Norwegian Central Bank.¹⁴

He returned to Bergen to fill a new professor chair in economics set up for him at the Norwegian School of Economics and Business Administration. He was again appointed rector, a position he held until he retired in January 1957 due to health conditions.¹⁵

4.4 Wedervang and public duties

Wedervang had a direct and outspoken personality, and a remarkably practical approach to economics. As professor and rector he was involved in many representative duties. In 1931 he was appointed chairman of the committee set up to examine the Norwegian foreign trade and shipping industry. From 1932 he was leader of the Norwegian trade emergency council. In 1932–1933 he was commercial expert at the trade treaty negotiations with the United Kingdom, and in 1934–1935 chairman of the committee concerning the fishing industry. During the same period he was also member of the committee assessing the organization of the Ministry of Trade, i.e. Department of finance and trade. Wedervang was also chairman of the Neighbouring Countries Board 1935–1939, and held a permanent office at the Ministry of Trade. He was appointed representative at the meetings of the International Institute of Statistics in Prague in 1938, in Washington in 1947 and in Berne in 1949. He was member of the board of the Nansen Fund and member of both the board and council of the Norwegian Fund for War Risks Insurance. He was representative in Norwegian research councils, and a prominent member of the Norwegian Academy of Science since 1927, and later also the American Statistical Association and the International Institute of Statistics.¹⁶

He was awarded a series of honors and distinctions. Among others he was an officer of the French

Legion of Honor.¹⁷ The most prestigious, however, was probably commander of the Royal Order of St. Olav, granted in 1947.

4.5 The birth of the Wedervang Archive

After having received funding from the Rockefeller Foundation and the Norwegian Fund for War Risks Insurance, the Institute of Economics was set up at the University of Oslo and started its work in January 1932.¹⁸ As a practical oriented economist Wedervang was genuinely interested in economic history as a tool of understanding the present economic situation and forecasting the future. His idea was that significant lessons could be drawn from the past in order to understand the problems of the interwar depressions. He believed that some of the answers could be found by studying historical time series of important economic indicators. As a consequence, the work on the compilation of historical prices and wages started along with the set up of the Institute of Economics.¹⁹

The work was very time consuming, but as the project had generous funding, as many as 46 full-time or part-time assistants were hired to compile the data during the heydays of the project in the 1930s.²⁰ Hence, the project was of a considerable size. His assistants searched through many kinds of archives and sources in their efforts aiming at establishing the best possible coverage of historical series for wages and prices for Norway from 1800 onwards. The data were taken from both public and private archives and records. The national archive, regional archives, Statistics Norway, central and local government files, public institutions, companies and offices served as sources. The bulk of the data concerning the private sector stems from business archives and records, farm or industrial plant accounts, bourses, employers' and employees' associations and newspapers.²¹ The data became so huge in numbers that an archive had to be set up almost from the start of the project, more precisely during the spring of 1932. The initial project is fairly well documented in the archive itself. This was done by assembling important correspondence and administrative logs into files, which were stored in the archive.²²

Between 1932 and 1936 the compilation of data went on at an impressive pace. The amount of collected data became so numerous that the staff was about to lose overview. In consequence, a new time consuming task of systemizing the data started. Some series were aggregated, whereas other were unified into shared tables. The process of documentation was given high priority. From 1936 the archive became part of one of the largest Norwegian research projects in economics ever, *The Economic Structural Survey of Norway*.²³ The project was initiated and led by some of the leading Norwegian economists, like Ragnar Frisch, Wilhelm Keilhau, Ingvar Wedervang and later

Arne Skau.²⁴ Among these, Frisch and Wedervang had the strongest interests in the data from the archive. Wedervang was also given the responsibility to continue as leader of the data collection and systemizing work.

4.6 The archive in hibernation

In connection with Wedervang's work on his projects he published, together with Dag Coward, a handful of studies on the structure of different Norwegian trades and industries during the 1930s. These included studies on the costs and terms of trade of retail industries, including discussions on hardware, grocery, drapery, book and tobacco trades.²⁵ In these studies important information was drawn from the wage and price historical archive, and in fact some of the hand-written manuscripts from the projects are still kept in the archive.²⁶

However, Wedervang was never able to use the data to the large degree he planned for. There are two main reasons for this. In the first place, the work on the archive was given lower priority as he took up his chair in Bergen in 1937. Secondly, the funding of the project was stopped under the German occupation of Norway April/June 1940 – May 1945. Then, in 1941, the bulk of the archive was packed down from the University of Oslo and sent to Bergen. The plan was to resume the work, with limited resources. However, since Wedervang was disliked by the German occupiers, and forced back to Oslo in 1942, only to be imprisoned and later dismissed from his duties, the archive remained untouched for several decades.

On his return to Bergen after the war, Wedervang still had plans for the archive. However, as he became occupied with a successful expansion of the Norwegian School of Economics and Business Administration, he never had the time to resume the work with the archive again.

4.7 The archive reborn

On Wedervang's retirement in 1957 he still stressed the possible usefulness of the archive. However, he died on December 4 1961. At that time the archive had stayed untouched for twenty years, and remained so until the end of August 1973, when Ole Gjølberg of the Norwegian School of Economics and Business Administration reopened it after 32 years of storage. When the files were unwrapped, Gjølberg found a seemingly unsystematic archive. Thus, he started reorganizing and restructuring its content. During this work he soon traced the framework of an originally systematic and organized archive. Hence, his work was carried out impressively fast. In November 1973 Gjølberg finished his survey of the archive's content, which finally was published the year after.²⁷

²⁶Wedervang Archive, file W057.

²⁷Gjølberg 1974a, 3–4.

The 403 different files at the time were basically organized in two major blocks; one for wages and one for prices. Wages were in principle organized according to their related industry or sub-industry, when prices in principle were organized according to the processing chain, i.e. import prices, product prices, gross prices, institution prices, market prices, retail prices and export prices.²⁸ The survey of Gjølberg also reveals that considerable parts of the data were aggregated, in some cases up to a national level.

Gjølberg did not report any definite number of direct observations of total prices and wages recorded in the archive. However, he concludes with 1.5 million observations for sailors. Later research has confirmed that this number is correct.²⁹ However, some of these observations are double-counted. Thus, the actual number of different single observations is lower.³⁰ This is still a quite impressive number, and can probably not be matched by any other known manual historical archive. For other industries, e.g. road construction, the number of observations must have been far higher than assumed by most scholars engaged with the archive.

The unwrapping of the archive was followed up by research on the development of prices, wages and the standard of living. This was the second wave of research linked to the archive after decades of hibernation since the original work conducted by Wedervang and his staff in the 1930s. The new work was basically done by postgraduate students of economic history from the Norwegian School of Economics and Business Administration, and was published in their theses. Instead of putting data into the archive it was now used as data source, in accordance with the original idea.

Already in 1974 Ole Gjølberg published a thesis on real wages and the standard of living for farm labor covering the years 1830–1880.³¹ The main source of the publication was farm accounts kept in the archive. The following year Lasse Reinholdt utilized the rich data to examine sailor's wages in one of the important Norwegian ports at the time, i.e. Tønsberg, 1847–1914.³² Further, Agnar Tjeldnes and Per Kr. Bekkelund examined wages for road construction workers in parts of Northern Norway 1870–1910.³³ Ole Gjølberg published extensively by using data from the archive in a number of smaller research papers, before he submitted his doctoral thesis on the Norwegian merchant fleet and its relation to the economy 1866–1913.³⁴ Again, the archive served as one of the major sources. On the basis of his work on maritime wages Gjølberg also shed new light on a major issue in Norwegian maritime history, the slow substitution from sail to steam in the late 1800s and early 1900s in an article published by the *Scandinavian Economic History Review* in 1980.³⁵ The same year Fritz Hodne and Jan Ramstad calculated the productivity development of Norwegian agriculture 1865–1910 assisted by data from the archive.³⁶

4.8 The research project of the 1980s

A new research project was launched, with a threefold purpose. In the first place, one wanted to stimulate research on the basis of the data records. Secondly, secure the files from destruction, and thirdly, make the archive more userfriendly by computerizing it. The duration of the new project was planned to six years; 1 January 1981 – 31 December 1986. Seven institutions funded the project. The social science council and the humanist council of the Norwegian Research Council granted NOK 597000, The Norwegian School of Economics and Business Administration granted NOK 541000, Norges Bank (the Central Bank of Norway) NOK 46700, and finally Hedmark, Hordaland and Telemark road construction offices NOK 60300. All in all, the funding amounted to NOK 1.245 million.³⁷

The project had a steering committee of four experts within different fields: Atle Alvheim (information technology), Ole Gjølberg (economic history and the Wedervang Archive in particular), Sofie Rogstad (private archives) and Kari Skrede (social science research). It had a staff of five, all employees at the Norwegian School of Economics and Business Administration. Jan Ramstad (leader), Geir Løkken, Kjell Bjørn Minde, Brita Nordstrønen and Judy Heggvik. The project was set up in cooperation with an international network represented by Professor Lewis R. Fischer, University of Maryland, USA, later Memorial University of Newfoundland, Canada, Professor John J. McCusker, University of Maryland, USA and Helge W. Nordvik of the University of Bergen, Norway.

The same year as the project started, four publications drawing on the files from the archive came out: Fritz Hodne published his textbook *The Economic History of Norway 1815–1970* (Norges økonomiske historie 1815–1970).³⁸ Hodne and Gjølberg mapped market integration during periods of Norwegian industrialization.³⁹ Helge W. Nordvik published on the wage conditions for Norwegian sailors in the Canadian merchant fleet 1863–1914, whereas Jan Ramstad presented a draft on female wages in the textile industry.⁴⁰

The project succeeded in safeguarding the files and in promoting research both on a national and international level. Considerable effort was put into organizing and documenting the files. Also, a number of catalogs were published explaining the content of the archive systematically. A great deal of this work was carried out by two of the research assistants employed in the project, Kjell Bjørn Minde and Geir Løkken. As for the computerization of the data, the work was far more difficult and time demanding than assumed. Thus, only surveys of the contents of the files were computerized.

New publications drawing on the exhaustive data sets of the archive were published as part of the latter project. Whereas the early works predominantly investigated nominal wages, Jan Ramstad presented a new consumer price index for Kristiania (Oslo) in order to map real wages for female employees in the textile industry 1850–1910.⁴¹ This was published for a wider audience in 1986,

⁴⁰Nordvik 1981, 79–86, Ramstad 1981.

⁴¹Ramstad 1982, Ramstad 1983.

when Ramstad and Minde gave an overview of trends in Norwegian real wages 1730–1910.⁴² Minde continued the work on real wage trends within the limits of the project.⁴³ Ramstad also published four works on wages for road construction workers on the basis of files in the archive.⁴⁴

Øivind Gladø, Trond Olav Seim and Geir-Helge Sjøtrø, utilized records from the archive in a thesis on Norway's dual economy.⁴⁵ Torill Lønningdal examined wages for female domestic servants on farms in Eastern Norway 1850–1910.⁴⁶

When Helge W. Nordvik took up a position as associate professor at the Norwegian School of Economics in 1986, he became the leader of the Wedervang Archive, staffed with one full time assistant. From the mid 1980s to the late 1980s Nordvik and Lewis R. Fischer worked extensively with the archive's impressive files of sailors wages. This research gave new information of considerable importance for international maritime history research.⁴⁷

4.9 New utilization

Due to illness, Nordvik's work on the archive ceased in the 1990s. However, the material was set at free disposal for other scholars and a new group from the Norwegian School of Economics and Business Administration, under the leadership of Professor Fritz Hodne used records from the archive in order to construct real wage series for Norway from the mid nineteenth century to the mid twentieth century. Two papers were published internationally as part of a European project.⁴⁸ Later, two new textbooks on Norwegian economic history in the nineteenth and twentieth century also included new series from the archive.⁴⁹ Ola Honningdal Grytten, who was part of Hodne's team, continued this work together with Kjell Bjørn Minde, a former research assistant at the archive. Two new international publications were put forward.⁵⁰

After the sudden death of Professor Nordvik in 1998, Professor Grytten took the responsibility of the Wedervang Archive in 1999. In 2004 he was appointed leader of a steering committee, with Bjørn L. Basberg and Jarle Møen as members. The archive was moved to more secure premises and it was reorganized according to the original catalogues made in the 1970s and 1980s with Odd Magne Havneraas as archivist. A new project aiming at improving the basic catalogues was started. After a careful examination of the content of all records and files a new catalogue was completed in 2006.⁵¹

⁵¹Grytten 2006.

At the same time, Norges Bank (The Central Bank of Norway) took interest in the under-utilized archive. The bank was working on a project providing historical monetary statistics for Norway back to 1819, and Grytten was asked to construct historical price and production series. This was done on the basis of several sources, the archive being one of the most central in the work with the GDP-series and the most central one in the work with the consumer price index. The resulting historical time series, a.o. a consumer price index for Norway 1516–2003 and a GDP-series for Norway 1830–2003, were published by the Central Bank in 2004 as part of its project on Historical Monetary Statistics.⁵² The same year a consumer price index for Norway 1819–1871 was published in the European Review of Economic History.⁵³ In 2005 another work on real wages from the eighteenth century till present was printed in a second publication related to the project by Norges Bank.⁵⁴ An finally, new historical series on wages, containing data drawn from the archive, are presented in Chapter 5 and 6 of this volume of Historical Monetary Statistics for Norway.

Internationally, David S. Jacks at the University of California, Davis, USA and later Simon Fraser University, Vancouver, Canada, among other foreign scholars, visited the archive several times in the early 2000s. Data from the archive is used in Jacks' PhD on international economic integration in the nineteenth century.⁵⁵ This is also the case for several other papers by Jacks, published in top international journals like *The Journal of Economic History* and *Explorations in Economic History*.⁵⁶

4.10 The present structure of the archive

Today the archive holds 471 files of documentation, raw data, systematic data and processed series. Each file has its own number. These numbers were basically given chronologically, which implies that they were given as running numbers and not thematically.⁵⁷ The files are classified into five major sections according to their content, as listed below.⁵⁸

Content classification:

1. Administration of the archive
2. Wages
3. Prices
4. Accounts
5. Miscellaneous

Wages and prices by far constitute the two largest groups, with 242 and 122 files correspondingly. The files are presented very differently, and the levels of processed raw data vary considerably. In the catalogue the files are also classified by four different kinds of content according to their state of processing.⁵⁹

Processing classification:

1. Overview material
2. Basic material
3. Systematic material
4. Processed material

Overview material contains descriptions of sources, information on the data or topics related to these. These files also include some analysis carried out on the basis of the material in the archive. Basic material is in principle raw data or primary data recorded or copied in the archive. Systematic material includes data, which are organized in a systematic way in order to be utilized by users of the archive. Processed material is data, which has been organized and processed in order to find different kinds of aggregated series.

Table 4.1 below reports the classifications of the files in the archive according to their content and the state of processing of the data. As the archive stands today, most of its records are classified as

⁵⁷Gjølberg 1974a, 7–53.

⁵⁸Grytten 2006.

⁵⁹Grytten 2006.

basic material, i.e., 244 files. However, the level of data classified as systematic material, i.e. 82, or processed material, also 82, enable us to come up with some aggregated series on wages and prices for some products quite easily.⁶⁰

TABLE 4.1

4.11 Content of the archive

As already shown, the content of the archive is manifold. And if one seeks a detailed description of the files one has to search through the catalogues. However, a few lines can be said about the data, following the content classification above.⁶¹

4.11.1 Administration of the archive

This part basically holds correspondence, documentation of the work in progress, reports, letters of recommendation and general information of the work on the establishment of the archive. Thus, it deals with technical-administrative aspects. Unfortunately, some of the files were not sent along with the bulk of the archive from the University of Oslo to the Norwegian School of Economics and Business Administration in 1941, and still remain in Oslo.

Correspondence

The bulk of the administrative section of the archive holds important correspondence in connection with the data collection and the work on the archive and the different projects it sorted under. Here we also find records of employees, and important traces of the archive's first history.⁶²

Documentation

This part gives documentation of data collection, sources and work organization. It gives a fairly good insight in how the principles of the archive structure were established, and the importance of well documented and empirically sound data files.

Others

This part offers working lists and letters of recommendation for Wedervang's staff. From this file we can get a feel for how the archive was established, how the data were collected and how various challenges of different matters were solved. It also gives a fairly good impression of Wedervang's personal care for his employees.

4.11.2 Wages

This material consists of detailed wage data from a number of sources, stretching from public offices to merchants and ship owners. Although the exact number of observations is unknown, the archive is probably reflecting a two-digit million observations.⁶³

⁶¹Alme 1992a.

⁶²Gjølberg 1974a, 5–6.

⁶³Wedervang Archive, W516, W517 and W324.

Merchant fleet

According to the documentation files in the archive, this material holds several hundred thousands of data, reporting individual wages for almost 1.5 million sailors.⁶⁴ After a closer look at the material, however, these numbers may not take into consideration double counting. Nevertheless, this is one of the richest international data source for sailor's wages in the eighteenth and nineteenth century. The data stretches from 1751 till 1921. The main source is public recruitment offices in the Norwegian ports. Wages are reported in different ways. By direct reports written by the ship captains, contracted salaries and *ex post* salaries. These are often overlapping, and thus, can be controlled against each other. All capacities of crew, except captains, are included, implying up to 26 different capacities in 26 ports. Wages from both foreign going and domestic going vessels are recorded, and even some international wages from foreign ports.

Some of this material has been systemized and processed into regional or even national aggregates for different capacities of crew. The data is very well organized from 1819 onwards. The number of observations is also reported in the aggregated tables.

Road Construction

The magnitude of this part of the wage material is second only to the merchant fleet. It basically consists of wage and financial account reports from public road construction financed by the national parliament and carried out in the counties. It stretches from 1850 onwards and reports daily and hourly payments for employees on fixed and piecework wages (from 1854). A substantial number of observations are also given for hired workers with horse. Most of the data are given county-wise, while some series are aggregated up to national levels.⁶⁵

According to these files, there are several million observations of public road construction workers. One has to keep in mind, however, that these are not direct observations, but wage costs divided by working time. The data becomes poorer in 1915 and cease around 1920.⁶⁶

Railway construction

These files basically report daily and weekly wages for day hired labor on piecework and labor on fixed contracts. Some observations are also reported in hourly wages. The numbers of observations are estimated in the same manner as for public road construction. Thus, it is very high. The data basically start in 1873 and end as late as 1940, however, with a lacuna 1884–1891, when railway construction activity was low.⁶⁷

Like for public road construction, the wage data for railway construction reflect a two-digit million number of observations of daily and hourly wages. However, the number of direct observations is significantly smaller.

⁶⁴Wedervang Archive, W201

⁶⁵Alme 1992b, 4–9.

⁶⁶Ramstad 1984a, Ramstad 1984b, Ramstad 1985a, Ramstad 1985b.

⁶⁷Alme 1993, 15–16.

Manufacturing

The files containing manufacturing wages are fragmented. Most of them are records from individual companies or manufacturing plants. Some of these date back to 1820. However, the bulk of data stems from the second half of the nineteenth century. Also, parts of the newer data often reflect the state of professions, industries and sub-industries rather than that of individual companies. Some data are taken from branches of the Employers Federation, founded in 1900.⁶⁸ The best example of this kind of material is probably wage data from the mechanical engineering employers' federation.

A substantial part of the data is taken in towns and urban areas. They were taken as annual, monthly, weekly, daily or hourly wages. Some include board and lodging, some do not. All in all, they cover most years 1820–1930. Admittedly, they have a regional bias in favor of the Oslo-region. However, this was also the center of the manufacturing industry in the nineteenth century.

Agriculture

Most data on agriculture is kept in the section for farm accounts. Moreover, wages from seven farms and two foresting employers are also in separate files in the archive. Here we can trace wages within agriculture and forestry from 1820 till 1913. Most data are reported as daily, some are taken weekly, monthly or annually. Some include board and lodging.⁶⁹ In addition to these files the farm account section of the archive holds important data on wages in agriculture and forestry.⁷⁰

Others

This section holds six files of basic and two of processed material. The wage files cover smaller parts of various industries, branches, sectors and professions, like mining, crafts, the public sector or just different kinds of occupations in towns and urban areas.⁷¹ The two processed files hold data reports and calculations of the value of boarding and lodging.

4.11.3 Prices

The price data also stem from a number of sources, both private and public. They come from merchant archives, business accounts, local product bourses and exchanges, public offices, institutions and government ministries. It is the second largest group in the archive, stretching back to 1641 and ending in 1940.⁷²

⁶⁸Alme 1993, 16–18.

⁶⁹Gjølberg 1974a, 22–30.

⁷⁰Alme 1993, 13–15.

⁷¹Gjølberg 1974a, 31–37.

⁷²Wedervang Archive, files W134, W135, W212, W254 and W388.

Documentation

The first sub-section of prices deals with documentation. In all the 14 files we find well documented descriptions of how the price data was collected both at first hand and by the Wedervang staff. The user is also provided with information on how observations taken in different currencies are transformed into one unit, basically the krone.

These files also reveal that some price series are converted into fixed currency, i.e. they are adjusted for currency fluctuations. The documentation files' detailed descriptions of the sources and the data compilations also enable the user to examine the validity and reliability of the price material in the archive.⁷³

Market prices

This is the second largest sub-section of price data, and one of the best documented, classified and organized parts of the price section. The data reported are basically market place prices to consumers registered by public servants in the larger towns and cities of Norway. They start as early as 1830 and continue till 1920. Prices on some 70 products were reported, half of them must be considered consumer products. However, it is not possible to follow all items continuously over the time.⁷⁴

The local magistrates were formally responsible for the data collection. The prices were reported to the statistical office of the Ministry of Domestic Affairs and organized and processed by them. Most files report prices by cities or towns, some at national levels. They were partly taken monthly, partly quarterly.

Prices on goods

In this sub-section we find the richest source of prices in the archive. It holds different sorts of market prices. The most important is publicly reported market prices on a set of 15–72 products.⁷⁵ These were assembled by decree from the government. Again, magistrates and public servants were responsible for the collection of data. There were strict standards for how these prices were to be measured. They included both typical consumption goods and gross products and inputs to production. The prices were to be taken at least quarterly, often monthly or even more frequently. The archive includes data from 40 Norwegian towns and cities from 1832 onwards.⁷⁶ These are also to a great magnitude aggregated on product levels and geographical levels.

Other important sources for this sub-section of prices is retail prices from shops, merchant houses and different kinds of market places, special time-limited markets or product exchanges. It also holds price currents from newspapers, bourses or trade chambers. Likewise, it reports gross and product prices (factory gate) from similar sources. In this sub-section we can also find institutional prices

⁷³Gjølberg 1974a, 38–48.

⁷⁴Grytten 2004, 52–53.

⁷⁵Wedervang Archive, W272, W273, W274, W275 and W276.

⁷⁶Grytten 2004a, 58–61.

for hospitals, garrisons, prisons, local governments and similar institutions. Most price series end between 1910 and 1914, some of them continue till the 1930s.

All in all this part of the archive consists of 63 files, which has served as the main source in the construction of price indices previous to 1900 for Norway. Still, many of the files can be considerably further explored.

Agricultural prices

Despite this part contains only 12 files it is rather interesting. In the first place it includes prices on crops from 1641 onwards.⁷⁷ Secondly, it includes the northernmost parts of Norway better than most other sources and files. Thirdly, some series in these records are reported as imports, product, gross, retail and even export prices. Fourthly, they are very well documented. The bulk of the data stretches from 1860s onwards. However, officially collected market prices on crops, peas and potatoes exist from 1736, when official appraisal prices go even further back in time; to 1641.

Some series also include prices of milk and milk products along with different kinds of meat, wool and wood. Most of them cover the period up to World War I, when some continue into the early 1920s.

Fish prices

These files are also very rich on price data. Some of them can be traced back to 1700 and cover the period till 1940, when the bulk covers the nineteenth century.⁷⁸ Again this sub-section, as the previous one, reports many kinds of fish prices, i.e. catch prices, gross prices, market place prices, retail prices, export prices etc. Some fish products are reported in stunning numbers of qualities, and often according to the waters and seasons in which fish was caught.

An important reason for this remarkably detailed material is the impressive fish price records from Bergen, where prices were recorded at the local commodity bourse (the fish market) by merchants and public servants. However, the archive also reports fish prices from many other ports of exports and towns of consumption, e.g. Stavanger, Haugesund, Ålesund, Kristiansund, Tromsø and Oslo. The data continues to the mid 1930s.

4.11.4 Accounts

These make up the third largest group in the archive, with 82 files. They are taken from farms, dairies, construction work and miscellaneous kinds of bodies and activities. Dairy accounts (milk factories included) constitute the largest of these groups, followed by farm accounts. Both of them, in particular the latter, is supplemented with files on farm and dairy wages and prices.⁷⁹

⁷⁷ Wedervang Archive, file W155.

⁷⁸ Wedervang Archive, files W051, W097, W098, W099, W100, W101, W102, W208, W397 and W408.

⁷⁹ Grytten 2006.

Farm accounts

All in all, the 27 files of farm accounts along with files on farm wages give information from 57 farms, basically major farms in eastern Norway. Though, some accounts exist for farms located in other parts of the country. Most of these files hold basic material, i.e., raw or unprocessed data. Some of them stretch back to 1820.⁸⁰ They mostly cease before World War I.

They provide reasonably good information on prices, wages and working conditions, and may serve as tool for the calculation of non-cash payments. Information on different sets of prices, input, output and value added can also be drawn from these files.

Dairy accounts

The 46 files of dairy accounts constitute another impressive part of the Wedervang Archive. The accounts are taken from dairies located in eastern Norway, mid-Norway and all along the coast from the south to the northern parts of the country.

The accounts hold information on wages, costs, sales, input, output and corresponding prices. Hence, they may serve as solid sources for the calculation of reliable value added series for this industry back to the 1860s.⁸¹ Unfortunately, the data in these files, which primarily must be classified as basic material, have hardly been used for research purposes.

Construction accounts

The archive holds two files with construction accounts.⁸² The most interesting of these is probably construction accounts for the Royal Palace in Oslo from the nineteenth century. However, we can also draw information on other public and private construction accounts from the material in this sub-section.

Others

This sub-section has seven files, containing public and private accounts and a detailed consumption survey. Of special interest is two studies led by Wedervang himself. One is on the profitability in the merchant fleet in the 1930s, when the other is on the income and cost structure of colonial gross trade during the same decade.⁸³ In the records we find data from the nineteenth century until the end of the interwar period.

⁸⁰Gjølberg 1974a, 22–30.

⁸¹Wedervang Archive, files W138, W367 and W374.

⁸²Wedervang Archive, files W410 and W411.

⁸³Wedervang Archive, files W022B and W057.

4.11.5 Miscellaneous

In this section we find 14 files with correspondence, documentation and data related to the pioneer projects the Wedervang Archive was part of. Thus, we find technicalities concerning the data and the data collection along with the administration of the data files. We also find surveys and census data along with manuscripts with link to the data in the archive. This implies that this section has a substantial degree of overview material and hardly any basic data.

Correspondence

This sub-section contains three files with correspondence on data collection and related issues. We find correspondence both among the Wedervang staff and between the staff and different bodies providing data.⁸⁴ This material gives a good insight into how the work with data processing was conducted.

Exchange rates

Here we find descriptions of the Norwegian currency system and exchange rates covering a very difficult period in monetary history 1757–1842.⁸⁵ These have been used in several price and wage series in the archive to correct for exchange rate fluctuations from currency par values. This implies that some of the time series on wages and prices in the archive are not nominal, but real series, in the sense that they are exchange rate adjusted.

Others

The final eight files have different contents, covering comments, manuscripts, letters, censuses, conference proceedings etc. Seven of these files are classified as overview material, whereas one is considered processed material.⁸⁶ They give insight into how the data were meant to be used by the senior staff of the archive at the time of its creation.

4.12 Conclusions

Since the ambitious start of the Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices in January 1932, the archive was left so to say untouched from 1941 to the autumn of 1973. From then on, the focus on the archive has fluctuated substantially. During limited time spans it has been used by small groups of researchers, but then left alone when their projects came to an end.

⁸⁴Wedervang Archive, files W073 and W505.

⁸⁵Wedervang Archive, file W155.

⁸⁶Grytten 2006.

During the last five years the archive has caught the interest of numerous scholars, both Norwegian and foreign, and the number of visitors is increasing. In 2006 the archive had 118 registered visitors of whom 84 Norwegians and 34 foreigners. The majority of visitors were economic historians, followed by economists and then historians. In addition, a total of 81 requests were made about the archive, of which 37 from domestic scholars and 44 from abroad. Along with new research activity initiated by Norges Bank, the Norwegian School of Economics and Business Administration and staff from the Simon Fraser University, this implies that the archive is now probably more used for international research purposes than ever before.

Still the files of one of the largest manual historical archive on wages and prices in the world must be considered under-utilized, and the bulk of data has still not been used at all. In view of the great visions of the two pioneers of the archive, Wedervang and Frisch, and in light of the overwhelming analytical possibilities hidden in the data, considerably more research could and should still be carried out on the basis of the archive.

CHAPTER 5

Nominal wages in Norway 1726–1940 by occupation

Ola H. Grytten¹

This chapter presents historical wage series organized by occupation for more than 100 different types of jobs in the Norwegian labor market from 1726 to 1940. The bulk of the data are collected from the Wedervang Archive, which is presented in Chapter 4, and supplemented with data from private archives and previous research into historical wages along with data from Statistics Norway.

¹Ola H. Grytten is Professor in Economic History at the Department of Economics, Norwegian School of Economics and Business Administration, and special adviser to the Research Department, Norges Bank.

5.1 Introduction

On the basis of research connected to the project on Historical Monetary Statistics hosted by Norges Bank, the present chapter offers an overview of historical nominal wages for Norway covering the period between 1726–1940. For corresponding data for the years 1940 onwards, we refer to a very rich material published by Statistics Norway.^{2,3}

We have been able to follow the development of wages for several different categories of labor, industries and sub-industries. We have not been able to follow the same classification as Statistics Norway use for their modern wage data, but have, however, tried to follow a similar approach to that of Statistics Norway for their historical wage statistics.⁴ Thus, on the basis of available historical data and historical classifications by Statistics Norway, we are currently able to present wage series for different occupations in the following eight main industries:

1. Agriculture and Forestry
2. Construction
3. Manufacturing and Mining
4. Crafts
5. Communications
6. Maritime transport
7. Domestic services
8. Public services

Whereas the data for the first seven industries basically reflect *ex post* wages, the data for the last industry, public services, reflect *ex ante* wages. This implies that additional payments, e.g., inflation adjusted and family responsibility compensation are excluded from this latter industry.

We stress that the data presented here reflect wages as compensation for labor input, and not total income. Thus, capital income and subsidies are not included. The data used here are basically drawn from three different sources. The first and most important source is Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices kept at the Norwegian School of Economics and Business Administration in Bergen.⁵ The second source is Statistics Norway, from where the data are taken from different publications. The third major source is records from previous research into Norwegian historical wages.

²See e.g. www.ssb.no/emner/lonn, NOS 1978, 537–555, NOS 1994, 253–278 and NOS 1990, 1991, 1992, 1993, 1995, 1996, 1997, 1999, 2001, 2002, 2004 (Wage Statistics), 32–138.

³Data for the two sub-periods can of course be combined, and in Chapter 6 of this volume we present annual wage series which cover the entire period 1726–2006, classified by industry.

⁴NOS 1994, 253–278 and www.ssb.no/emner/06/05.

⁵See Chapter 4 for a detailed description of the Wedervang Archive.

By compiling relevant data from these sources we arrive at relevant and consistent wage series for labor in different occupations in eight industries, covering the bulk of the Norwegian labor market 1726–1940.

5.2 Historiography

Substantial effort has been put into research on the development of wages in Norway. Most of this work has been rather fragmental, however, and few aggregated series at a nation wide level have been published. Most studies concentrate on local industrial plants, communities or branches of industries. Most of these studies are results of rather inductive historical research taking advantage of available sources. Thus, the Wedervang Archive at the Norwegian School of Economics and Business Administration has been used widely as source in many of these studies.

5.2.1 Agriculture and domestic services

In 1974 Ole Gjølberg conducted his first research on wages in the agricultural sector of the 1800s.⁶ On the basis of data from the Wedervang Archive and Statistics Norway, he gave estimates of farm wages for the period 1830–1850 and, thereafter, more precise computations up to 1880. Torill Lønningdal continued this work with an analysis of domestic servants' wages on 17 major farms in Eastern Norway 1850–1910.⁷ These series included both domestic services and agriculture.

Håvard Teigen presented wage data from the Wedervang Archive in his analysis of the economic development, including wage development, in rural parts of Eastern Norway.⁸ For the period after 1910 wage data on manpower in agriculture has been assembled by Ola Honningdal Grytten and calculated into real wage series in order to map the development of living standards and examine causes of unemployment.⁹

5.2.2 Construction

Per Kristian Bekkelund and Agnar Tjeldnes also used the Wedervang Archive in order to map wage development for public road construction workers in Northern Norway during the last decades of the nineteenth century and the early 1900s.¹⁰ Later, Jan Ramstad mapped public road construction wages in Southern Norway. These were deflated by available international price indices and by working time units per barrel of crops in order to conclude on the development of real wages.¹¹ Given the rich data material on construction wages in the Wedervang Archive, surprisingly little has been done in order to examine wage developments and the standard of living for construction workers.

5.2.3 Mining, manufacturing and crafts

A substantial part of historical studies on wages in Norway have been carried out on the manufacturing industry. An early work in this field was Erling Petersen's series of wages for employees in the engineering industry with main focus on 1900–1950. The series were taken from the national association of employers, NAF. These series were deflated into real wages by using available cost of living and consumer price indices reported by Statistics Norway.¹²

In 1979 Ingeborg Fløystad presented her pioneering work on the Baaseland and Næs Jernverk, an iron producing company located in southern Norway. She gave wages for different occupations connected to the company. Her work covers the period from 1726 till 1806. In the work by Fløystad nominal wages were deflated by prices on staple food products, basically grain and potatoes. She presents five-annual wages for mining, manufacturing and crafts.¹³ One problem with her series is that they fail to fully take into account the different values of the changing currencies at the time. Thus, they do not satisfactorily reflect the development of real wages in the eighteenth century. Another problem is that some of her data are adjusted for exchange rate fluctuations. Thus, they are not fully nominal, as assumed by her.

Matti Goksøy offers annual data of manufacturing and crafts wages 1820–1865, taken from the old industrial plant and village connected to the Alvøen paper mill, founded in 1797, on the outskirts of Bergen.¹⁴ His data reflect money wages, and thus boarding and lodging for the families of the employees have to be added, as is also the case with most wage series from this period. In order to find real wages, he offers estimates of necessary working time in order to buy units of grain.

Jan Ramstad solely uses the Wedervang Archive in his efforts to map female wages in the manufacturing industry in Christiania 1850–1910.¹⁵ The wages compiled by Ramstad were basically drawn from female labor force in the textile industry. Ramstad also constructed a new cost of living index for Christiania covering the period 1850–1910 to obtain his real wage estimates.

Kjell Bjørn Minde has paid attention to the standard of living for working families in one of Norway's first modern textile manufacturing companies, Arne Fabrikker, also located at the outskirts of Bergen.¹⁶ He has presented wages from the start up in 1846 to 1920.¹⁷ His data are not annually taken, but quite detailed. He also focuses on comparative analyzes with other occupations, companies and industries.

Christian Venneslan of the Norwegian School of Economics and Business Administration has examined the manufacturing industry's breakthrough in Norway 1896–1939 in a quantitative manner. As part of his study, Venneslan gives valid and reliable series of manufacturing wages for several sub-industries. His estimates are calculated on the basis of thousands of observations drawn from

Statistics Norway's statistical records of the manufacturing industry of the period in question. Along with the wage series, he also reports product prices, which enables him to calculate product real wages, i.e. nominal wages deflated by prices at the factory gate.¹⁸

5.2.4 Maritime services

The Norwegian merchant marine became the world's third largest international fleet during the 1870s. Wages for all capacities of crew except ship captains were recorded in recruitment offices located in all major ports of the country. Thus, due to a very rich data source of maritime wages kept at the Wedervang Archive, substantial efforts have been carried out in order to analyze wages and living conditions for sailors.

The first scholar to widely utilize the records of sailors' wages was the American economic historian Lee Soltow, who compiled and examined annual sailors' wages from ports around the Oslo fiord in the 1960s.¹⁹ A decade later Lasse Reinholt utilized the Wedervang Archive to examine seamen's wages in the important maritime port Tønsberg, also located by the Oslofjord.²⁰

Later Ole Gjølberg used the data from the archive both to examine wage development and the transformation from sail to steam in the Norwegian merchant fleet. Thus, he examined sailors' wages from sailing and steam vessels.²¹ Then, in the 1980s another American took up the challenge left by Soltow. Together with Helge W. Nordvik of the Norwegian School of Economics and Business Administration, Lewis R. Fischer, from Memorial University of Newfoundland, Canada, used the records from the Wedervang Archive to examine sailors' wages both as cost component and as indicator of the standard of living.²²

5.2.5 Public services

Wage series for public services have been scarce. However, in 1993 Kjell Bjørn Minde published his PhD-dissertation on the profitability of higher education in Norway in the late nineteenth and the twentieth century. In his work he came up with estimated career-long wages in public services. Wages are also given on an annual basis in his work.²³

In order to establish numbers of the size of the Norwegian public sector 1830–1865 Elisabeth Bjørsvik used data on public wages in order to calculate the sector's contribution to GDP.²⁴ Implicitly, real wages for the public sector can be drawn from both Minde and Bjørsvik. However, they are not continuous and not directly comparable to most other wage series at hand.

5.2.6 Aggregated series

Some scholars have tried to map more general trends of Norwegian wage development. In the 1980s Kjell Bjørn Minde and Jan Ramstad were hired into a project, aiming at initializing research on the basis of the Wedervang Archive. As a result, a significant amount of work was undertaken mapping the macro development of nominal and real wages. Their most cited work was published in the *Scandinavian Economic History Review* in 1986 under the title “The development of real wages in Norway 1730–1910”.²⁵ In this work they assembled available wage series representing some key industries of Norway at the time. However, the most important part of this paper was a presentation of Jan Ramstad’s new cost of living index for Oslo starting in 1850 ending in 1910. This price index made it possible to offer reliable annual real wage series as far back as 1850.

Minde and Ramstad’s wage series were quite fragmented before 1850 with considerable lacunas. However, they served as the first step of analyzing wage developments for Norway during the eighteenth and the nineteenth centuries. Minde also published widely on wage developments of different industries basically in the nineteenth and early twentieth century.²⁶

Along with the work of Minde and Ramstad, John Eivind Myhre gave an overview of Norwegian wage developments and research into this field from the mid eighteenth century till the outbreak of World War I, also published in the *Scandinavian Economic History Review*.²⁷ Axel Kiel and Lars Mjøset, compiled existing wage series for different industries wage formation in Norway 1840–1985 in the same journal.²⁸

In the 1990s another group of scholars from the Norwegian School of Economics and Business Administration published new aggregated series of wages for Norway 1850–1950, covering six different industries, i.e. road construction, manufacturing, agriculture, the merchant fleet and domestic services (housekeeping).²⁹ Again the research was carried out chiefly on the basis of the Wedervang Archive and the Ramstad cost of living index. The work was part of a European project on the standard of living in the nineteenth and twentieth centuries. Minde and Grytten continued the work on aggregated real wage series for key occupations, industries and sectors of the Norwegian economy 1850–1940.³⁰

Finally, Grytten, as part of the Historical Monetary Statistics project in Norges Bank, tried to tie up the loose ends by combining the previous work with un- and under-utilized sources to construct aggregated and economy-wide wage series for able seamen and manufacturing workers in Norway from the early 1700s till present days.³¹ The nominal wage series were deflated by the consumer price index published in the first volume from the Historical Monetary Statistics project³² to arrive at real wage series.

5.3 Problems connected to historical wage data

Working with historical wage data is a complicated task for several reasons. In the first place, the data is not always in abundance. The longer we go back in time, the more difficult it is to trace relevant data, or in fact, data at all. Often we are left with rather few observations, and their validity and reliability may often be questioned. In this work we have set certain requirements for the data to be used. There should be several observations for an occupation in any year to be taken into account. Also, the reported figures need to be representative for a wider group of workers belonging to this occupational group.

Secondly, time series often lack consistency and persistency. Very often time series on wages as well as other variables continue for a limited period. Thereafter, we have to construct new series from other sources, often based on different principles of accounting and different variable definitions. Some series may be given in annual wages, some in monthly and some in daily or even hourly wages. When we take into account that the definition of e.g. a craftsman versus a manufacturing worker can differ substantially between sources and over time, we can easily see that we may be running into problems. Thus, we seek to construct consistent series by splicing them and calculating them into a comparable unit of account, both in terms of currency, time and wage units.³³

This brings us to a third challenge: definitions and classifications. The character of different occupations has changed widely during the last three centuries. Hence, we have to decide on definitions and classifications of occupational belonging. We have decided a historical or dynamic approach, i.e. one belongs to a certain occupational group according to standard definitions or understandings at that time.³⁴ This means that what we nowadays would probably classify as craftsmen or artisans could be defined as manufacturing workers in the eighteenth, nineteenth and early twentieth century, depending on the understanding at that time. By choosing this method, we use a standard historical approach to the past; understanding history on its own terms.

A fourth major challenge is to reconcile present and historical wages. One basic problem here is how to treat boarding and lodging. For most employees in the eighteenth and early decades of the nineteenth century cash payments just made up a fraction of total wages. Very often the employers provided housing and food, and often even clothing for their employees' families. In many cases wages were in fact provided for families and not for individuals. On the other hand, the families had to offer their entire manpower to the employers. Thus, cash wages are not representative for total wages, and we should not look at individual payments, but family income from work.

Another problem connected to these arrangements is that the way of organizing these ties between employers and employees differed not only through time, but also within time, industries, sub-industries and even within companies. In some cases the company fully provided clothing, housing and food, in other cases only partly.³⁵ Thus, we have tried to find the necessary additions for boarding and lodging for each wage series in order to make them consistent over time. We will also

³³Grytten 2005, 62–65.

³⁴NOS 1994, 253–260.

³⁵Minde 1996, 69–76.

stress that this work does not focus on total income, but on wages. Additionally, our basic unit of study is not the household or the family, but the individual. This does not imply that salary paid with regard to support responsibilities do not count. Rather we are focusing on payment granted for the work effort carried out by each individual.

In the fifth place, there is a challenge connected to changing currencies and their par values, devaluations and revaluations. In early work on historical prices and wages from the nineteenth and early twenty centuries there is a clear tendency that scholars adjusted their data according to fluctuations in market values of currencies.³⁶ This implies that prices and wages were indirectly adjusted for inflation. In fact, this is a way of making nominal series more like real series. Here, in order to establish nominal series we omit and in a few cases even have to reverse this procedure. However, we are still left with huge challenges when it comes to different currencies used in the period we cover in the present work. In particular the period previous to 1816 is very difficult, as wages were reported in different kinds of currencies. As for the period 1813–1816, the Norwegian economy experienced monetary chaos with several monetary revisions and devaluations.³⁷ Thus, wages were reported in different currencies with different and fluctuating values. Through a thorough study of our data, exchange rates, monetary revisions and par contra devaluated values of currencies we have been able to sort out this problem in order to make the series consistent over time. Another problem is that money had different bargaining values at local markets. However, this was basically a problem for the price quotations more than for the wage data.³⁸

5.4 Sources

As already mentioned, the Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices constitute the most important source for the new and revised series presented here.

The archive holds price data back to 1641 and wage data back to 1751.³⁹ The bulk of the records, however, stems from the nineteenth century, and basically covers the period up to 1920. But some data also exist for some newer observations. It is probably one of the richest manual archives of its kind worldwide, with some million direct observations on both prices and wages. These are compiled and partly aggregated from a considerably higher number of observations. Thus, they are believed to represent a two-digit million observations on both prices and wages. We do not know the exact numbers.

The data kept in the archive are collected from various original sources. The most important ones are public records, local exchanges and bourses, trade and commerce chambers, merchant houses, industrial plants and different accounting material. Most wage data from the public sector are collected from public offices connected to the central or local governments and later Statistics Norway.

³⁸Grytten 2004, 61–63.

³⁹Wedervang Archive, W043, W044 and W155.

Sailors' wages, which start as early as 1751, are basically collected from recruitment offices in the Norwegian ports, where the ship owners or captains by decree were to report wages of their crew.⁴⁰

Private wages for other industries are basically collected from the accounts of private companies, branch reports or later registrations made by Statistics Norway. For the period prior to 1850 the data in the archive, with the exception for sailors, are scarce when it comes to salaries. However, they are good enough to construct persistent annual series of crafts, manufacturing, agriculture and domestic services from the 1820s and 1830s. These never cover as many occupations as the registrations from Statistics Norway do for the period 1885–1910.⁴¹ Nevertheless, the archive offers annual data, whereas Statistics Norway offers data for six years with five years intervals only. Thus, the Wedervang Archive is the best source for wages from 1820 till the first two decades of the 1900s.

A second source of data in the series presented is, as already mentioned, Statistics Norway. In several publications they report both public and private wages for different industries and occupations along with information on income and property.⁴² These basically start in 1850. The records were originally taken by the magistrates in towns and cities and by the local police authority in the countryside (sheriffs (lensmenn) and their deputies). They were chiefly assembled by the ministry of domestic affairs until Statistics Norway was founded in 1883. Before 1875 the data basically covered domestic servants and hands hired by the major farms in the high seasons. The bulk of the data were not taken on an annual basis. The five-annual wage data were published by Statistics Norway under the title *Tables concerning Wages*.⁴³ Annual records on wages were not recorded regularly by Statistics Norway before the interwar years, despite the fact that they start earlier for some industries.

The third main source of data for wages are research works published by different scholars, especially the pioneer works done by Ingeborg Fløystad and Matti Goksøyr.⁴⁴ These records report wages for employees in manufacturing and crafts from the entire eighteenth century and the early nineteenth century. The data also enable us to include non-cash payments. Both Fløystad and Goksøyr have compiled their data from company records and accounts. In addition to these series, we use branch association records of payments per employee. The most important series is daily and hourly wages representative for all blue-collar employees in the mechanical engineering industry. These have later been included into the records of both Statistics Norway and the Wedervang Archive. The best overview of wages in the mechanical (engineering) industry is, perhaps, given in the work on the Norwegian Employers Association by Erling Petersen.⁴⁵

5.5 Aggregates

The series presented here are basically meant to represent different occupations. Both micro and aggregated series are offered. In order to establish estimates of aggregates, we add several occupations within corresponding industries or sub-industries by giving each series a weight. For some occupations and industries, e.g. sailors in the merchant fleet, we do have annual numbers of observed wage units. When these are representative for the group we are dealing with, they serve as annual weights according to a Paasche approach. However, for most series we do not have these annual registrations of the number of employers belonging to each group. Thus, we have to find information elsewhere.

This is basically found in the national population censuses, taken approximately every tenth year,⁴⁶ which give information on the size of industries, sub-industries and occupational groups as well as on the distribution of gender in the labor force. Hence, by using these records we can give each series a weight according to their coverage, i.e. the size of the labor force within their industry they serve as representative indicators for. We can use this information to find constant weights covering several years. By combining them with the wage data we reach at weighted averages by a Laspeyres approach. Due to variable coverage at different periods, we do not always calculate “pure” averages. This would, in the first place, have caused breaks in the series. Secondly, we would have had sub-periods with wage levels not reflecting the total picture, but only the industries present in the data set. However, by splicing series we adjust for this problem. In consequence, we end up with conditional, but nevertheless representative averages rather than unconditional but not representative averages.

5.6 Wage series

In the following section we present nominal wages for several occupations within eight main industries. In order to make the series comparable they are presented in daily units. This is not a straightforward task. Those who were paid hourly, weekly, monthly or by annual salaries did not necessarily have full normal working days. Some of them were seasonal workers, some just hired in when useful. This implies that we need to be careful not drawing premature conclusions on the level of general income per day. In this chapter daily wages has been chosen as the basic unit of presenting continuous series, but we also refer some monthly and annual wages.

The series are also presented in Norwegian kroner, implying that the spesidaler (originally speciedaler) before 1875 and the riksdaler (originally rigsdaler) before 1816 are transformed into kroner. For the spesidaler we use the par exchange rate, i.e. four kroner to one spesidaler. For the different kinds of riksdaler we use, with some modifications, the official exchange rate of the outgoing currency against the incoming currency.⁴⁷ Hence, we arrive at continuous wage series from the early eighteenth century and up till 1940. As for the period after 1940, we refer to wage data published by Statistics Norway.

⁴⁶NOS 1949, 34–37 and NOS 1978, 36–37.

⁴⁷Eitrheim 2005, 5–10 and Grytten 2004a, 54–61.

5.6.1 Agriculture and forestry

Most Norwegian farmers were independent small-scale farmers, and were not employed on a permanent basis on farms owned by others. However, during the high seasons the largest estates had to hire help from the smaller farmers in order to keep up with all the necessary work required to produce efficiently. In many cases such kind of work was to compensate for land rents, i.e. land rents were paid from small-scale farmers to landowners by working on the latter ones' farms. Our data from the agricultural industry stems from hired work.

The data are basically recorded from two sources, i.e. public records and the Wedervang Archive. The data in the Wedervang Archive were collected from 57 farms starting as early as 1820. These were some of the main farms in Norway at the time. Thus, they might not give a representative picture of the average income for farm hands. Also, they include different kinds of workers, like domestic servants, craftsmen, proto manufacturing workers, labor in forestry and work leaders. Hence, these data have to be critically used. They basically cover male labor up to 1850 and thereafter both male and female workers. However, some data exist for women also before 1850. Both summer and winter seasons are included. Most workers were partly paid in non-cash wages, which has to be included in our series. The coverage is best from 1850, with annual observations put together by Gjølberg and Lønningdal, but also the data from 1830 onwards can be used.⁴⁸ Additionally, a deeper dive into the Wedervang Archive makes it possible to include data from 1820 onwards.⁴⁹

In public records, later held and collected by Statistics Norway, we find observations of daily wages for agricultural workers for every fifth year starting in 1850 for men and 1875 for women. The records report daily wages for both the summer and the winter season. The five-annual series from the bureau can be complimented on the basis of annual figures given by the Wedervang Archive as indicator of the development from year to year. These records continue till 1915, when they are substituted with annual and more detailed wage series published by Statistics Norway.⁵⁰ In these latter series there is good coverage of both traditional agricultural industry and forestry. They also reflect seasonal differences, as data are given for four kinds of agricultural occupation for men and women during the summer season, i.e. spring, summer and autumn, and general farm work for men and women during the winter season. Additionally, they report wages paid for men in forestry during both summer and winter.

As said, the records report both wages with and without boarding. Here we include both, but with an emphasis on full cash wages without boarding. These were paid to workers who provided their own food. We prefer these when possible because they have the best coverage. Additionally, the difference between cash wages for workers with and without boarding to some extent mirror the value of boarding. For the period previous to 1850, most wage data do not include food provided for the workers on the farms. Thus, it has to be added to the cash wages. However, some workers were paid in cash only, and we do have some data on their wages previous to 1850 too. After 1850

⁴⁸Gjølberg 1974, 135–153 and Lønningdal 1984, 141–163.

⁴⁹Wedervang Archive, W027, W028, W204, W205 and W207.

⁵⁰NOS 1949, 366–367.

the picture is mixed. Full cash payments were more common from the last decades of the nineteenth and the dawn of the twentieth century, in particular during the interwar period. However, still a significant part, perhaps as many as all of the agricultural workers, were partly paid in non-wages until the post World War II era. Nevertheless, we give priority to the cash wages here, due to their relative preciseness.

There has been done some work on the value of extras, basically food and lodging. Both the Wedervang staff, Lønningdal and Gjølberg have tried to map the value of these services and added them into their wage series.⁵¹ They all conclude that boarding and lodging was by far the most important factor of income for hired labor in agriculture during the nineteenth century. A problem with most of these estimates is that they, with a possible exception for the Wedervang estimates, add a more or less fixed share of non-cash wages to the cash wages. Here, we try to examine annual values of non-cash wages independently of cash wages.

Food provided to labor on the farms has been added on the basis of a normal consumption basket for working class families, which is the closest we can come to agricultural workers in the existing public consumption surveys for years close up to the observations.⁵² Instead of adding a constant factor for food or a variable with a constant ratio to cash wages, we have found estimates of consumption in base years, i.e. 1850, 1880 and 1910 and calculated annual consumption by interpolation with a CPI as indicator of the fluctuations.⁵³ By doing this we find that previous additions for boarding and lodging tend to be both too static and too high, in some cases far too high.⁵⁴

The data for agriculture make it possible to compare male and female wages annually from the 1870s. Drawing more information from the Wedervang Archive it is also possible to give estimates on female wages in agriculture back to 1820. This is done by using information from farm accounts in the archive and estimates of the annual value of boarding and lodging on the basis of the above-mentioned consumption surveys.⁵⁵ In years where we do not have sufficient information on female wages we calculate them as a residual between total average and average male wages.

By connecting the data from Statistics Norway and the Wedervang Archive we arrive at continuous and persistent data for nominal wages in the agricultural sector in Norway 1820–1940. These are reported for men and women in Figure 5.6.1.

By looking at the relative share of female to male wages, we notice an interesting phenomenon. Female wages stayed relatively stable at around 60 per cent of male wages during the first decades. Then, after a short boom in the mid- and late 1850s they approached 65 per cent in the 1880s and 1890s. However, in the early 1900s female wages fell dramatically to male wages and were almost touching 50 percent just before the outbreak of World War I. Thereafter the gap was significantly narrowed until the late 1930s.

FIGURE 5.1 Daily male and female wages in agriculture, incl. boarding and lodging, in NOK, 1820-1940.
Semi-logarithmic scale.

Sources, Wedervang Archive, W009, W013, W014, W021, W027, W028, W204, W205, W207, NOS 1949, 366–367, Gjølberg 1974, 31–103 and Lønningdal 1984, 141–163.

A natural explanation for this development is that non-cash wages played a major role in the 1800s, whereas cash wages became more important during the increased market orientation of Norwegian farming in the 1900s. Thus, female wages dropped first. Then in the 1920s and 1930s one saw a general trend towards narrowing the gender gap.

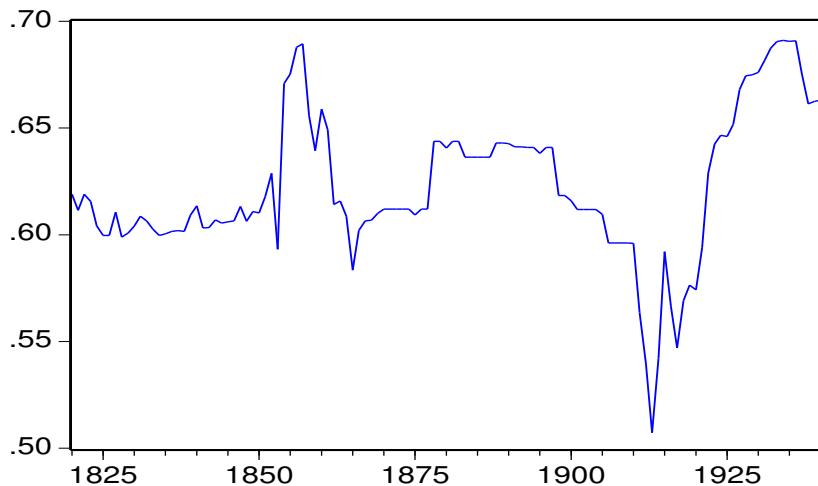

5.6.2 Construction

Within this industry we have labor from five different occupations: road construction, railway construction, bricklayers, telecommunication and harbor construction and maintenance. Our data start in 1850 and cover every year till 1940. Again, the data are taken basically from the Wedervang Archive the entire period up till 1940, and supplemented by data published by Statistics Norway for the interwar years.

The road construction data cover construction and maintenance work on public roads financed by local or central governments. The wages are reported on a daily basis. An astonishing number of more than 13.4 million observations were taken to arrive at annual numbers for piecework employees from the start in 1850 up to the interwar period. The corresponding number for workers on fixed salaries was almost 1.1 million. The data are reported practically from the entire country.⁵⁶ The wages were in principle paid in cash for the entire period. In many cases the workers were provided

⁵⁶Wedervang Archive, W118, W119A, W120A and W249.

FIGURE 5.2 Ratio of female to male wages in agriculture, 1820–1940.

Sources, Wedervang Archive, W009, W013, W014, W021, W027, W028, W204, W205, W207, NOS 1949, 366–367, Gjølberg 1974, 31–103 and Lønningdal 1984, 141–163.

food at work, for which they had to pay with a deduction in their cash wages. However, the wages reported in the archive were gross and not net wages in this respect. In addition, there were, to our knowledge, no significant change of practice during the period we are looking at. Thus, the reported wages are representative and consistently measured over the entire period. In consequence, we use them here. Both summer and winter season data are included.

From 1915 onwards, we also draw our series from Statistics Norway, which from 1921 becomes a major source for our data along with the data from the Wedervang Archive.⁵⁷ The data from the bureau include both fixed and piecework salaries in public road construction all over the country.

The second most important group within construction, reported here, is public railway construction. The main source up to the interwar period is again the Wedervang Archive.⁵⁸ The series in the archive starts in 1873 and goes on till 1940, with a significant lacuna 1884–1891. For the last 20–25 years the data on railway construction worker's wages from the Wedervang Archive are supplemented by data from Statistics Norway.⁵⁹ On the basis of the Archival data it has also been possible to give rough estimates on railway construction data back to 1854. The wages are partly reported as daily wages and partly as hourly wages. We use daily wages here. Thus, we have to transform hourly into daily wages. Till 1913 it was common with ten working hours per day, which is clearly reflected in the wage lists for railway construction workers. For 1914 we find records with both nine and ten

⁵⁷NOS 1949, 365.

⁵⁸Wedervang Archive, W245 and W249.

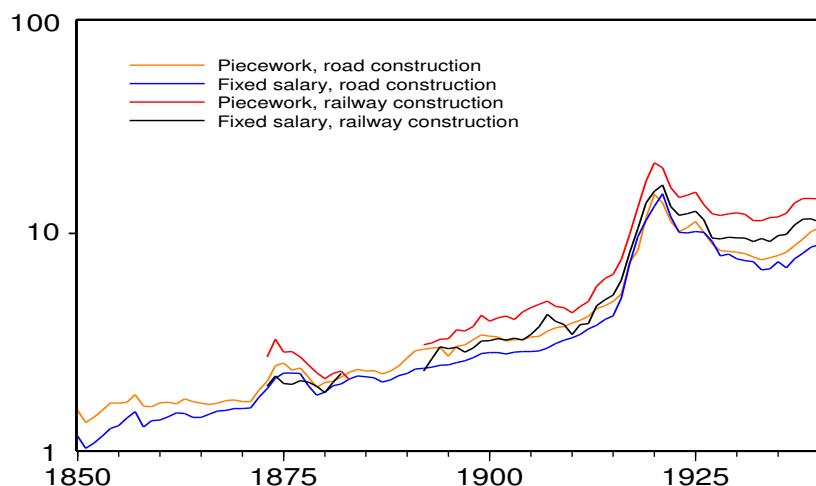

⁵⁹NOS 1949, 365.

hours as normal working days. For the period 1915–1917 a normal working day was nine hours, before it, at least officially, became eight in 1918.

As for food, we find the same pattern as for public road construction workers. Thus, we make no addition for boarding and lodging in these series. The number of observations of daily piecework and fixed wages for railway construction workers, which is the basis of the records in the Wedervang Archive, is an impressive number of 11.6 and 1.7 million respectively. The number of observations of hourly wages reflected in the archive is astonishingly 139.3 and 22.8 million respectively.⁶⁰ These numbers are not direct observations, but deducted from total wage expenses divided by total working hours.

Figure 5.6.2 maps the level and development of fixed paid and piecework labor within public road construction 1850–1940 and public railway construction 1873–1940. As revealed in the figure, hands engaged in piecework were paid significantly better than those engaged on fixed salaries. An exception is reported for road construction in the early 1920s, when the postwar depression caused less demand for labor. This primarily affected workers hired on short term and renewable piecework contracts, whereas workers on fixed long term contracts kept their full jobs longer.

FIGURE 5.3 Daily wages for piecework and fixed contracts in construction, in NOK, 1850–1940. Semi-logarithmic scale.

Sources, Wedervang Archive, W118, W119A, W120A, W245 and W249 and Alme 1993, 64–65.

From the interwar period we also include bricklayers, port (harbor) construction and maintenance workers and telegraph construction and maintenance workers into our series. These data were recorded and published by Statistics Norway annually with coverage for the up to 40 main cities and towns at the time. They were also taken at different months of the year. Hence, their coverage

⁶⁰Wedervang Archive, W245 and W249 and Alme 1993, 64–65.

must be considered good. These series were gathered and reported partly as hourly and partly as daily wages. We have transformed them all into daily wages in order to be able to summarize them consistently into aggregated series.⁶¹

5.6.3 Manufacturing and mining

In order to establish continuous wage series for manufacturing and mining we have to modify various kinds of data and link these to each other. By doing this we are able to come up with nominal series for every fifth year for several occupations as early as 1726–1806, and thereafter, annual series from 1820 onwards till 1940. The data are drawn from a variety of sources, basically the Wedervang Archive, Statistics Norway, records from industrial associations and previous work done on the basis of business archives.

Our first source is the work carried out by Ingeborg Fløystad on wages for labor connected to Baasland and Næs Jernverk, a significant Norwegian iron producer in the eighteenth century, located close to Arendal.⁶² Fløystad reports wages for different occupations within manufacturing and crafts every fifth year, starting in 1726 and ending in 1806. The records give annual wages, where cash, boarding and lodging are all included. They are reported in riksdaler, ort and skilling (previously named schilling). A problem connected to this is the use of different types of the currencies called dalers, which tended to depreciate not only according to their decreasing silver content, but also relative to their formal silver value. Thus, we use the unit closest to the par silver value. Thereafter we have spliced the series in overlapping years according to formal exchange rates.⁶³

The next important source is the thesis by Matti Goksøy on working conditions at the Alvøen industrial plant outside Bergen, founded in 1897 and a pioneer in paper production based on hydraulic power.⁶⁴ The data cover different sets of observations. Here we use wage data covering the period from 1820 till 1865. Adding data from the Wedervang Archive we arrive at annual series for these years. They represent individual contracts between employees, their families and the plant. The payment depended on the contracts and remained fixed for several years. The wage level was, thus, a consequence of when the contracts were signed, the size of the family and the number of working hands in the family. Goksøy did not find signed contracts for every year. Thus, his series of cash wages tend to be stable over longer periods, which was in fact common at the time.

In addition to the cash wages, boarding and lodging counted for a significant part of total wages of the labor force at Alvøen. As already mentioned, consumption surveys from the mid 1800s provide us with information on the size of these non-cash payments. We arrive at about 60 per cent in 1850 and around 70 per cent in the early 1820s. By using the previously established consumer price index for Norway as indicator of the price movements of the non-cash wages, we are able to express these in current prices instead of fixed ratios, which is common among most writers on this topic. We add

⁶¹NOS 1920–1940.

⁶²Fløystad 1979, 595–596.

⁶⁴Goksøy 1982.

this to the cash wages and arrive at annual nominal wages 1820–1865.⁶⁵

In the Wedervang Archive we also find relevant wage information dating back to the early decades of the nineteenth century. A central source here is the records from Cappelen-Ulefoss, containing data of more than 20 different kinds of occupations related to manufacturing 1833–1867.⁶⁶ This source reveals that women were often paid only 25–30 per cent in cash wages, compared with men for similar types of manufacturing work. The files have significant lacunas, but are nevertheless very detailed, with records of names, dates of birth, family conditions and responsibilities, kinds of work and working hours. Thus, we are able to construct an annual series for daily wages among manufacturing workers at this important Norwegian industrial plant at the time. Our series derived from the Cappelen-Ulefoss files are for most years made up of more than 100 observations.

Another important source in the Wedervang Archive is economic records from the Kongsberg Sølvverk, a state controlled silver mine company dating back to 1624. In the records we have found wage data from 1820 onwards, just after the company restarted its silver production after a halt during the Napoleonic wars. The data report sporadic wages for blue collar, forestry and transport workers, whereas it is easier to follow the annual development of mining and manufacturing workers.⁶⁷ Due to the implicit way of reporting salaries, we hold these wage data to be somewhat inferior to the data collected from Cappelen-Ulefoss and Alvøen.

From the middle of the nineteenth century, the Wedervang Archive is the by far best source for manufacturing wages. The archive holds wages for various occupations in various manufacturing companies. Admittedly, the data are somewhat biased as the eastern parts of the country are best represented. For the 1830s and 1840s the data in the archive are dominated by huge industrial conglomerates within mining, wood and paper.⁶⁸ From the late 1840s textiles and mechanical industry take over this dominant position.⁶⁹ Women are included in the material for most years. For some series we have to add boarding and lodging. From the 1870s the archive reports annual data on the basis of some thousands observations of hourly, daily, weekly monthly and annual wages.⁷⁰ The most common unit is daily wages. The number of observations is increasing until 1920, thereafter falling.

Christian Venneslan's PhD-dissertation on the Norwegian manufacturing industry 1896–1939 provides new reliable and valid series of wages in manufacturing companies under the governmental demanded national insurance scheme. Most employees of companies of a certain size were covered by this arrangement, and thus, the series provided by Venneslan are of high value.⁷¹

For the last years prior to 1920 Statistics Norway becomes our main source for manufacturing wages, collected in up to almost 50 towns and industrial settlements.⁷² Additionally, Statistics Nor-

⁷²NOS 1918–1941.

way give data on average manufacturing wages for key manufacturing branches and aggregated series for manufacturing as a whole. These, of course, have a very broad coverage of manufacturing wages in the interwar period, and represent both valid and reliable aggregated series of manufacturing wages during the last decades prior to World War II. However, in the data there is a negative bias towards new manufacturing industry in suburban areas and towards smaller companies located all over the country. Manufacturing plants organized in employers' federations are also better represented in these data than non-organized companies.⁷³ Erling Petersen is a main source for wages in mechanical engineering industry 1910–1940, through the rich and convincing data collection and presentation in his book on the Norwegian Employers Association 1900–1950.⁷⁴

FIGURE 5.4 Daily nominal wages in manufacturing industry, in NOK, 1820–1910.

Source, Goksøyr 1982, NOS 1918–1941, NOS 1949, 364–365, Petersen 1950, 670–671, Grytten 1992, 159–167, Hodne, Grytten and Alme 1995, 240–241 and Wedervang Archive, W045, W046, W047, W048, W049, W054, W055, W056, W071, W072, W074, W074, W080, W081, W082, W121, W284 and W417.

In Figure 5.6.3 we compare daily nominal wages for the “new” industries mechanical engineering and textile. As seen from the figure, mechanical (engineering) industry soon became a wage leader, whereas textile was lagging constantly behind. A major reason for the latter development was of course the huge share of female and young labor force in the textile industry, whereas mechanical engineering on the other hand had a significant share of skilled male workers.

⁷³NOS 1949, 364–365 and NOS 1918–1941.

⁷⁴Petersen 1950, 670–671.

5.6.4 Crafts

The data for crafts, like manufacturing, start in 1726. Again, our first source is Ingeborg Fløystad's work on the Baasland and Næs iron plant.⁷⁵ Fløystad reports five-annual wages for hammer-men and their assistants in manufacturing and for craftsmen connected to the iron plant in general. She also includes boarding and lodging in her series. The series constructed by Fløystad are reported as wages per year. In order to make them comparable with other data for crafts they are expressed as daily wages here by dividing them by the estimated number of 300 working days per year. These series conclude in 1806, just before the start of the high inflation period connected to the Napoleonic wars.

Thereafter, the Wedervang Archive is again our main source. First, we use wage data for senior blue-collar workers at the Kongsberg Sølvverk (silver plant) starting in 1820. These data report craftsmen responsible for smaller labor units. Again, the files basically provide us with implicit material on wages, which have to be extracted from financial records.⁷⁶ However, they serve as the best indicator we have available for salaries in crafts 1820–1833. The records stretch further up towards the end of the nineteenth century. We use them up to 1850. Boarding and lodging has been added here according to the same principles as for manufacturing workers.

We have persistent wage data on crafts from 1833 onwards. Most data for the first decades are taken from the Cappelen-Ulefoss industrial plant.⁷⁷ From 1875 the data have a significantly better coverage, reporting daily wages for painters, masons, carpenters, bakers, tailors, shoe makers. These data were basically collected in urban areas, i.e. in 18–40 towns and cities. From 1915 they include eleven different occupations within crafts, and data are given for both urban and rural labor nation-wide, despite a clear Oslo bias. Thus, the data from 1875 onwards reflect thousands of observations.⁷⁸ After 1915 Statistics Norway takes over as our most important source. They also reports an aggregated series of daily wages for skilled artisans 1914–1940, with a significant lacuna during three of the war years 1915–1917.⁷⁹

A problem with the data from Oslo is that they suddenly start chiefly to report piecework during the second half of the 1890s, and they also to some extent give priority to tariff wages compared to *ex post* paid wages. However, the generous information in the Wedervang Archive provides the opportunity to adjust for these pitfalls. This has not been done previously, and is, thus, done for the first time here. By revising the data previously used and adding new unused data from the archive we arrive at new series with more moderate fluctuations both at the second part of the 1870s and at the second part of the 1890s. Figure 5.6.4 clearly reveals the differences between the “revised” and the “old” figures.

This latter series from Statistics Norway shows higher wages than the other series covering the

same period. This is due to the fact that the series only include skilled artisans, whereas the other series also reflect artisans under training. The latter series is also more heavily based on artisans in organized industrial companies, which generally had higher wages than elsewhere. Finally, the aggregated series on skilled artisans from Statistics Norway does not include suburban labor to the same degree as the other series. Thus, they show higher wages.

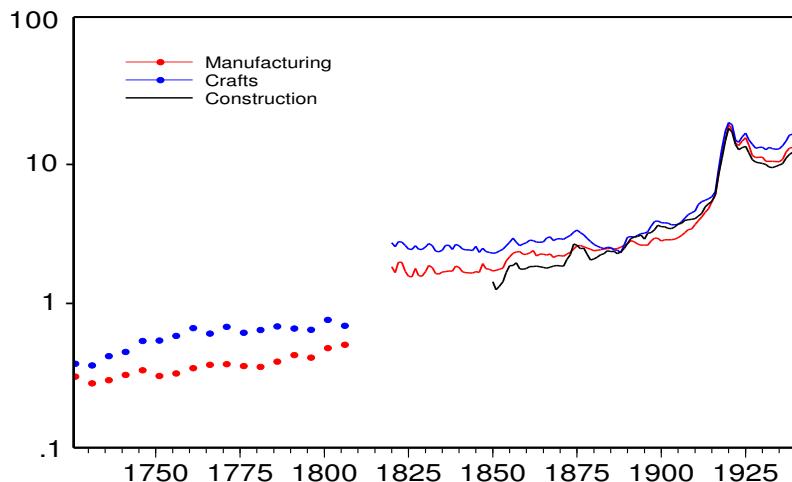

A drawback with the data on crafts is the wide exclusion of women. However, very few women had such occupations before the post World War II-period. Thus, the series presented here represent a fair share of labor in this industry.

Figure 5.6.4 shows the developments in representative average nominal wages for manufacturing, construction and crafts in Norway 1726–1940. Representative averages are meant as weighted averages according to the representability of the series. Thus, we only use the most representative and solid data sets. These are weighted by the size of the corresponding industry they seem to represent.

5.6.5 Communications

This industry is perhaps one of the most challenging in order to construct valid, reliable and persistent series. A major problem is to decide which occupations that historically were engaged within communications. Should, e.g. railway and telegraph maintenance in the nineteenth century be considered construction or communication? A related problem is that the sources do not always reveal differences of occupations. In other words: what does the term railway-worker include? In some cases

FIGURE 5.6 Daily nominal wages in construction, manufacturing and crafts, in NOK, 1726–1940. Semi-logarithmic scale.

Sources, Construction: Hodne, Grytten and Alme 1995, 242–243 ,Alme 1993, 64–65, NOS 1920–1940, NOS 1949, 365, Wedervang Archive, files W118, W119A, W120A, W245 and W249. Crafts: Fløystad 1979, 595–596, NOS 1915–1941, NOS 1949, 364–365, Hodne, Grytten and Alme 1995, 240–241 and Wedervang Archive, files W046, W055, W284 and W417.

it may include conductors, cleaners, maintenance workers, construction workers and even railway station staff. In many cases we do not have sufficient information about the observations to separate one group from the other. Thus, it is tempting to define this anonymous group of railway workers as part of the communication industry. This is in principle, what we have done here.

Our data, compiled from the Wedervang Archive, start in 1850 with public road construction workers providing their own horses. Thus, these men obviously provided transport or communication services. The number of daily observations varied between 225 in 1851 and 29,685 in 1896. The data were originally assembled all over the country.⁸⁰ Since the payments included the hire of the workers' horses, they are of course higher than corresponding series of workers not providing their own horses. In the 1850s the difference seems to have fluctuated around 100 per cent, i.e. a 100 per cent wage compensation for bringing ones own horse. In the 1890s the compensation fluctuated around 29–36 per cent. The gap was closing even further and reached 22 per cent in 1914.⁸¹

From 1854 the mentioned data are supplemented with other files from the Wedervang Archive. In this case these are records of daily wages from railways, i.e. the Norwegian Main Railway Network

⁸⁰Wedervang Archive, W118, W119A, W120A and W249.

⁸¹Alme 1993, 62–63.

1854–1910.⁸² The staff of the archive had to work fast with these sources, as they were in the process of being destructed due to reluctance of investigation into internal affairs by the railway trade union. However, the Wedervang staff was able to compile information on daily wages for up to 237 workers during a single year.⁸³ To the degree they were provided with food and housing by their employer this was basically included in their cash wages. Thus, we do not have to add extras for boarding and lodging in order to compare this group with other groups of occupation.

From 1915 we can also utilize data from Statistics Norway. From then on we have data on forestry transport by labor providing their own horse.⁸⁴ From 1920 onwards, Statistics Norway also give data for drivers. They include both horse drivers and motor drivers, and thus, reflect an important part of passenger and goods transport nation wide. From 1921 the records from Statistics Norway also include an aggregated series for labor in ports occupied with maintenance, transportation, and loading and unloading cargo and passenger vessels.⁸⁵

From 1918 onwards Statistics Norway reports hourly wages for telegraph workers, and from 1921 daily wages paid by port authorities. Data are given for both fixed wages and piecework.⁸⁶ The sources do not always distinguish between construction, maintenance and communication work, and the data are presented in an aggregated form. Unfortunately we have not been able to solve this problem by looking into the original sources, since the best tracks we find also give aggregated series. Thus, we include these series both under construction and communication.

In Figure 5.6.5 we try to illustrate the uneven development of wages within communication inclusive and exclusive of horses provided by the hired labor force. This is not a straightforward task, as the data do not cover the same occupations during the entire period. Thus, we have to splice different kinds of occupations within transport. In consequence, the levels of wages for some occupations have to be adjusted upwards, whereas others have to be adjusted downwards. Anyhow, the graph gives information both on levels and developments of wages for labor providing and not providing their own horse. The figure also plots a graph for average wages in communication 1850–1940.

We read from the figure that the relative wages of manpower providing their own horse came down until the first years of World War I. During the war the supply of horsepower became insufficient, and thus, we see a rapid relative increase in wages for hands providing their own horses. This development continued during the post-war boom from 1919 to the spring of 1920. The difference was thereafter reversed during the years of crises both in the 1920s and 1930s. In the mid-1930s the extra payment for providing ones own horse became marginal according to this graph. However, for this decade the wage data are not easily comparable, as wages for men with their own horses basically are taken from forestry, which was more depressed than most other industries during the 1930s. On the other hand, the negative development of extra payment for horses mirrors the trend towards of more motorized vehicles, and thus, surplus in supply of pure horsepower.

5.6.6 Maritime transport

We present wages for sailors from the merchant fleet from 1751 till 1940, which means that these series stretches almost eighty years longer back than most previously established series for seamen in the Norwegian merchant fleet. Additionally, the new series presented here include all capacities of crew listed at all ports where the records were taken. For the years up to 1844, we have data from sailing vessels only, since steamers were not permanently introduced to the Norwegian ocean going merchant fleet at that time.⁸⁷ From 1844 till 1921, we have data from sailing and steam vessels. Diesel motor ships are added when they first came into use in the early 1900s.⁸⁸ Finally, from 1920/1921 we have data for steam and motorized ships. In the records, seamen's wages are measured as monthly wages, without boarding and lodging.⁸⁹

The Wedervang Archive is used as source up till 1921. The section containing maritime wages is one of the richest and most impressive in the archive. The data in the section was collected from basically three types of sources. The first, which is a minor source, is *dischargement lists* ("avmonstringslister").⁹⁰ They were forms completed when sailors were discharged in domestic ports. The second source is *crew lists* ("bemandingslister").⁹¹ These contain detailed information on the voyage, crew, replacement of crew and their salary in domestic and foreign ports. In many ways

⁹⁰Wedervang Archive, files W173, W193, W320 and W407.

⁹¹Wedervang Archive, files W327, W329 and W330.

the *crew lists* constitute the best sources, since they include replacements in foreign ports. However, they were not utilized by the Wedervang team very often. The third, and most important source is *recruitment lists* (“påmønstringslister”), i.e. forms completed when sailors were recruited.⁹² These provide information on the name of crew members, residence, occupation on board, port and date of signing-on, and wages. One should note that this information is given only on crew joining in Norwegian ports on Norwegian ocean going vessels. Domestic ocean transport is excluded from the data.

The *recruitment lists* form by far the bulk of data on maritime labor in the archive. The wage data in the present paper are, thus, basically compiled from the *recruitment lists*. The total number of monthly wage observations taken from the archive is almost 690000, of which close to 440000 are taken from sailing vessels, and the rest from steam ships and a few thousands from motor engine vessels.⁹³ The seamen’s wages in the archive are compiled from 26 major ports. Records are taken for 26 capacities of crew, of which 15 are from sailing ships and 25 cover steam or motorized ships.⁹⁴ Table 5.1 reports the number of observations by crew capacity for the Norwegian ocean going merchant fleet reported in the Wedervang Archive and used in the present work.

Sources, Wedervang Archive files W030, W032, W034, W035, W036, W038, W039, W043, W044, W063, W172, W174, W176, W182, W184, W185, W186, W187, W188, W189, W248 and W349.

The data are taken from several lists in the archive, reporting both local registrations and national aggregates.⁹⁵ By combining these files, missing data have been added and calculation errors and misunderstandings by the Wedervang staff have been discovered and corrected.⁹⁶ The empirical bases of the series are quite strong from the early 1800s, and particularly from 1816 onwards.

For the period up to 1813, the data are reported in riksdaler. For the period 1813–1816, different types of the riksdaler and riksbankdaler have been used. From 1816 through 1876, wages are reported in spesidaler.⁹⁷ From 1877 onwards, they are reported in kroner. We have converted all data into kroner according to the procedure mentioned above.⁹⁸

For the interwar period, we use two different sources: data collected by Frode Akstun and by Statistics Norway. These are both taken from crew lists kept and reported by the ship owner's association.⁹⁹ Unfortunately, the number of crew capacities in these data is down to nine, and they basically account for steam and motor engine vessels. We don't know the exact number of observations these data are reflecting. However, on the basis of our sources, we can estimate them to more than 196.000.¹⁰⁰ The data here are presented without boarding and lodging, since they are omitted in the entire data set. Thus, it is best to exclude them when comparing relative developments within the wage series of the merchant fleet.

Since the well organized files containing sailors' wages in the Wedervang Archive include the number of observations for each port and capacity of crew, it is easy to compute aggregated series. Figure 5.6.6 reports wages for officers, ordinary sailors and mess crew (services), recruited in domestic ports by the Norwegian ocean going merchant fleet 1751–1940.

5.6.7 Domestic services

Also in the case of domestic services the Wedervang Archive is the key source for the early decades of the nineteenth century. For the period 1830–1850, we have traced data on female domestic servants in accounts from major Norwegian farms, basically quoted as daily, but also as weekly or monthly wages.¹⁰¹ These data are partly processed by Gjølberg in his work on farm wages from 1974.¹⁰² We have recalculated them into daily wages for the reason of comparison. According to these records, cash-wages stayed stable, whereas the supplements for housing and lodging fluctuated significantly. We have aggregated data from different farms up to one series. The statistical basis for this series is week, since the amount of annual observations are few, and even in some cases wages are just reported to have been stable over spans of several years. However, they still serve as indicators of the wage development in the period.

Sources, Wedervang Archive, files W030, W032, W034, W035, W036, W038, W039, W043, W044, W063, W172, W174, W176, W182, W184, W185, W186, W187, W188, W189, W248 and W349, Akstun 1960, 45–52 and NOS 1921–1941.

For the period between 1850–1920 the records improve significantly. Statistics Norway gives quinquennial data on wages for domestic male and female servants in rural and urban areas for this period.¹⁰³ The records are given for cash-wages only. Thus, one has to add for non-cash supplements, such as food and housing. By looking into the original material for these records, copied and kept at the Wedervang Archive, we find that there are some minor discrepancies between these copies of the original sources and the figures given by Statistics Norway for the first decades. Thus, we adjust the latter accordingly.

Alongside these records, we use Torill Lønningdal's aggregated annual series of wages for domestic female servants on major farms in eastern Norway 1850–1910.¹⁰⁴ These are constructed on the basis of files from the Wedervang Archive.¹⁰⁵ We use these records, with assistance from Ole Gjølberg's work on the wage development of agricultural workers and the annual series for female domestic servants in nineteenth century Norway, to construct estimates of annual wages for male servants from 1850 onwards.¹⁰⁶ It is reassuring that the records from the Wedervang Archive and Statistics Norway are closely correlated both in levels and in movements.

We run into two major challenges working with the data given for 1850 onwards. In the first place, they are primarily given as annual, secondarily as monthly or weekly salaries. In order to

¹⁰³NOS 1949, 366–367.

¹⁰⁶Gjølberg 1974, 85–107.

improve their comparability, we transform them into daily wages. Then, the central question is: how many days a year did they work? From the work by Lønningdal we know that it was common with one day off per week including vacations, which were not commonly given.¹⁰⁷ This lasted way up to World War II. Hence, the number of working days should be 313 per year. By dividing annual cash wages with these we arrive at daily numbers.

Our second challenge is to add for non-cash payments, basically housing and food (boarding and lodging) provided by the household or the farm where they served. Lønningdal has suggested fixed sums to be added to cash wages. These are given for periods stretching over several years.¹⁰⁸ However, by examining the composition of consumption expenditures from the nineteenth century, we conclude that the supplements must have been given a far too high value.¹⁰⁹ By finding the share of the household budget used on food and housing, we find reasonable sums to be added to the cash wages.¹¹⁰ These values differed between town and countryside. Their value is adjusted according to the price movements for food and housing in the Norwegian consumer price index for the period. Hence, by adding these extras to the cash wages we arrive at annual series of nominal daily wages for domestic servants stretching until World War II.

From 1915 Statistics Norway gives annual records of domestic female servants, and from 1918 also for cleaning and laundry ladies.¹¹¹ These data are given for the urban areas. By taking a closer look at the records from the statistical office, we notice that there is some confusion about boarding and lodging. An example of this can be taken from the office's publication *Statistical Survey 1948*. According to table 194, page 367, female domestic servants in rural areas earned an average annual salary of 291 kroner, including boarding and lodging in the early 1930s. This implies daily wages, boarding and lodging included, below one krone, which is significantly less than half of the value of boarding and lodging calculated by Statistics Norway for female domestic servants in urban areas. By crosschecking the data, we notice that the annual series for rural domestic services do not include boarding and lodging. We must also conclude, according to consumption surveys, that the values for non-cash payments are far too high in the other tables by the office.¹¹² By using the cash-wages and adding estimated non-cash wages provided for these women on the basis of consumption surveys and price developments, we obtain representative series of their full wages.¹¹³

To obtain annual wages for male and female servants in the urban areas, we have interpolated with the development of wages for men and women serving in rural areas. The interpolations are run between the five-annual observations up till 1915. For male labor in rural domestic services we have interpolated between the five-annual observations 1850–1875 with the help of series for domestic services in agriculture left by Gjølberg along with corresponding female series by Lønningdal.¹¹⁴

This, of course, means that three of the four data sets for domestic services before 1875 have weaker foundation than most other series. Figure 5.6.7 shows the development of urban and rural wages for domestic services both for men and women.

5.6.8 Public services

This is in fact one of the most difficult groups to map wage developments for. Neither the Wedervang Archive nor Statistics Norway is rich on wage data from this sector. Admittedly, the Wedervang Archive holds some sporadic data from the early nineteenth century, but these are not consistent with the series presented here.¹¹⁵ Also, Elisabeth Bjørsvik has studied salaries for public servants in her PhD-dissertation on the public sector's contribution to GDP in Norway 1830–1865. However, she does not give consistent series of individual wages.¹¹⁶

The best available source is probably Kjell Bjørn Minde, who studied the profitability of higher education in Norway 1885–1960. In his work he gives annual salaries for public servants according to their tariffs.¹¹⁷ We neither know the composition of employees nor how long they had been serving. In addition, we do not know their actual extra incomes for family responsibilities or compensation

¹¹⁵Wedervang Archive, file W028.

¹¹⁶Bjørsvik 2004, 290–310.

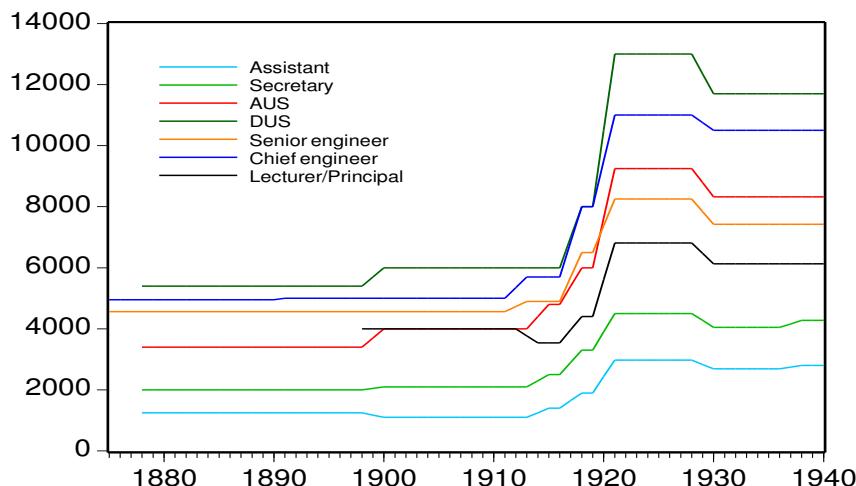

¹¹⁷Minde 1993, 25–123* (appendix).

for high inflation periods. Hence, these data are just tariffs and not at all *ex post* wages. Thus, they cannot be compared with the other figures presented here. They do not fluctuate as much as the other series, and in particular during high inflation periods they do not step up as much as wages for other occupations.

Anyway, on the basis of the work by Minde, we present average annual tariff wages for civil servants hired by both the central and local governments. These are civil servants employed by the central ministries, i.e. assistants and senior assistants, secretaries and senior secretaries, undersecretaries of state (AUS) and deputy undersecretaries of state (DUS). In addition, we present central government tariff wages for lecturers and training principals, assistant engineers, engineers, senior engineers and chief engineers.

Figure 5.6.8 offers a picture of the levels and developments of tariff wages for employees in the public sector from 1875 till 1940. Note the stability in relative wages between the different occupations.

FIGURE 5.10 Annual tariff wages for civil servants, in NOK, 1875–1940

5.7 Conclusions

This chapter offers an overview of existing, new and revised historical wage figures for different professions within eight main industries in Norway from the early eighteenth century till 1940. The main industries represented are agriculture and forestry, construction, manufacturing and mining, crafts, communications, maritime transport, domestic services and public services. The most long-

reaching series start as early as 1726, i.e. manufacturing and crafts, whereas the series with the highest coverage, i.e. sailors, start in 1751. All series presented here conclude in 1940. From the post-World War II years and onwards, Statistics Norway has a valid and systematic coverage of wage data, which can be spliced with those presented here. This is discussed in Chapter 6 of this book.

Three major sources have been utilized in order to compile the data. The most important is the Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices, kept at the Norwegian School of Economics and Business Administration in Bergen. The archive holds an impressive number of observations and is probably one of the richest of its kind in the world. The second most important source is records from Statistics Norway, whereas the third important source is previous work carried out on the basis of private business archives.

In order to make our data comparable, we have transformed the cited wages into one basic unit of account within the different professions. All series are transformed into kroner. This is in principle done by using par exchange values between outgoing and incoming currencies at the moment of exchange. Most series are also presented in daily wages here. However, for sailors we offer persistent and continuous series on monthly wages. As for public servants, we use annual salaries. For all groups we use *ex post* wages, except for employees in the public sector, where we use tariff wages. Thus, they cannot be directly compared to the other series.

We include both cash and non-cash payments in most of our series. Hence, we have calculated the value of boarding and lodging and added to the cash payments when necessary. However, this is not done for sailors. The main reason for this is that these data are reported persistently without boarding and lodging for the entire period. Also, boarding and lodging was not necessarily considered part of the sailors' wages. The sailors still had their own houses and provided their families own food.

The figures provided here should make a sound ground for comparisons between professions, within periods and over time. They also make it possible to compare payments for men compared to women, piecework compared to fixed wages and urban labor compared to rural labor.

CHAPTER 6

Norwegian wages 1726–2006 classified by industry

Ola H. Grytten¹

In this chapter the data on nominal wages by occupation presented in Chapter 5 are aggregated into data for nominal annual wages for 18 industries and sub-industries. In addition we present a national series for average annual wages 1726–2006. Our main sources for data are previous work by writers on Norwegian historical wages, The Wedervang Archive and records from Statistics Norway.

¹Ola H. Grytten is Professor in Economic History at the Department of Economics, Norwegian School of Economics and Business Administration, and special adviser to the Research Department, Norges Bank.

6.1 Introduction

In this chapter we present 18 annual wage series for different industries and sub-industries. In addition, we present a series of national average wages for 1726–2006. We basically draw on the material presented in the previous two chapters of this book. To recall, Chapter 4 describes the creation and working of Professor Dr. Ingvar B. Wedervang's Historical Archive on Prices and Wages at the Norwegian School of Economics and Business Administration, whereas Chapter 5 contains historical wage data (by occupation) mainly derived from the Wedervang Archive, supplemented by private records and data from Statistics Norway. The spliced wage series combine data from various sources. The most important sources up to the nineteenth century are previous historical research on wages compiled from different private archives. The Wedervang Archive serves as the single most important source for the period 1751–1940, whereas public records kept by different bodies at national or local levels provide us with a substantial amount of data for the nineteenth century up till 1940. Thereafter, our computations basically rest on wage data from Statistics Norway.

6.2 Classification

All wage series are transformed into annual wages measured in Norwegian kroner. In order to make this transformation, we have provided new estimates of normal working hours per man-year for the different industries. Table 1 shows our classification of wage data across the different industries and sub-industries.

Note that the series for aggregated industries are not averages of the quoted sub-industries, but representative numbers for the entire industry. Similarly, the last group *Total* is not the average of the quoted industries, but representative numbers for average wages for the entire economy.

TABLE 6.1
Classification of wage data by industry

Number	Classification	Industry and sub-industry
1	1.0.	Primary industries

6.3 Methodological challenges with the data

It is not a straightforward task to construct continuous wage series for a period covering almost 300 years. In the methodological field we have to come up with a number of creative solutions to numerous data challenges.

One problem has to do with the definition and classification of industries, in addition to occupations within the industries. The nature and title of most industries and occupations have changed dramatically over the decades and centuries, e.g. professions which in nature belonged to crafts in the eighteenth century later became manufacturing industry and finally service industries. Thus, it is very difficult to make valid classifications of industries and occupations over time. The present approach is to use the same classifications as were used historically. Nevertheless, we will have to bear in mind that the character of work and industry changed substantially over time.

Another methodological challenge is time units for wages. Some data are given in hourly wages, some in daily, weekly, monthly or annual wages. Data are sometimes given for piecework or as fixed time unit salaries. In order to compare these different time units, we have basically tried to recalculate all wages within each industry into one unit of time account, i.e. annual wages. Thus, we have found estimates of normal man-years by industry and by that transformed wages given in other time units into annual wages. As for piecework versus fixed wages, we recalculate the piecework wages into time unit wages according to their average salary per time unit worked. Then we find average wages for both piecework and fixed wage employees.

A third methodological challenge with the data is non-cash payments. In the eighteenth and first part of the nineteenth century these commonly made up the bulk of the wages for ordinary employees. Thus, we try to add them. Previously, non-cash payments were usually added as a fixed share of cash payments or just as a fixed sum. Here, non-cash payments are considered a basket of goods and services, basically boarding and lodging. The aggregated value of these products is calculated by multiplying estimated volumes of non-cash payments with their current price. By doing so, we arrive at variable non-cash payments, fluctuating with volume and prices.

The fourth challenge we will address here is the problem of different currencies used as unit of value account. In 1671 the Danish-Norwegian currency Rigsdaler Species was officially set to a

silver value of 9.25 dalers per mark fine silver. Rigsdaler Courant was originally set to a value of 81.6 per cent of the Rigsdaler Species. In 1795 this value was changed to 80 per cent. During the Danish-Norwegian King's involvement on the French side during the Napoleonic wars, Norway saw a period of monetary turbulence, with strong inflation and currency depreciation and devaluation. New currencies were introduced in order to regain control of the daler in the market. However, these attempts at restoring a stable currency system were unsuccessful and Norway went into monetary chaos 1813–1816.² Admittedly, one could argue this chaos started earlier and lasted until 1822. During this period it is very difficult to come up with consistent series of wages.

Additionally, for the period 1726–1842 the data sources tend to present manipulated data, by correcting them according to fluctuations in exchange rates. This was done in order to present them in par values of the daler. Moreover, in 1874–1877 the daler ceased as the key currency, which now became the krone.

In order to obtain continuous series of wages and prices in current values we use krone as our unit of account. The data adjusted for exchange rate fluctuations have been readjusted, whereas data in other currency units principally are transformed into krone by their formal values at the time when the observations were taken.

6.4 Paasche and Laspeyres wage series

Here the wage data are added up from micro series to occupational series, and from occupational series to series for sub-industries, industries and the total economy. Ideally we would use annual quantity weights for each micro series in our aggregated series according to the Paasche approach (V_P). That is, we would prefer to use the annual number of employed persons in each micro series in order to compute running annual aggregated series of average wages, as shown in equation 6.1:

$$V_{P,t} = \sum_j (v_{jt} q_{jt}) \quad (6.1)$$

Here v denotes nominal wages, q volumes, j industry and t year of observation. However, in many cases this formula has not been applicable due to shortage of employment observations. In consequence, we have used aggregated Laspeyres series with fixed weights during time intervals, according to equation 6.2:

$$V_{L,t} = \sum_j (v_{jt} q_{j0}) \quad (6.2)$$

²Eitrheim 2004, 1–18.

6.5 Weights

In order to arrive at aggregated series, we have to sum up sub-series. For the period 1946–2006 we use the same weights as Statistics Norway. For the period 1930–1945 we use annual weights according to the historical national accounts statistics concerning man-years carried out in the Norwegian industries.³ Thus, the total average wages 1930–2006 are calculated by a Paasche approach. For the years previous to 1930 we use benchmark year estimates of employment in the historical national accounts along with data from the population censuses.⁴ Hence, we use a Laspeyres approach in order to calculate total aggregated wages 1726–1929.

6.6 Man-years

In order to establish comparable figures, all series are presented as annual wages in the present chapter. From 1946 we have man-year data for all industries and sub-industries. For the pre-1945 period we have man-year wages for some industries, like public administration, education, domestic services and partly farming. For the rest we have to find man-years estimates for the period prior to 1946.

Most of our sources provide data in average daily wages. These take into account that the number of working hours shifted over time. Thus, we have to find the number of working days during a year. When the working hours in manufacturing was reduced to eight hours per day in 1919, the man-year became significantly shorter. We have taken this into account in our calculations. Holidays are excluded. As the number of vacation days was increasing, the number of working days decreased. Nevertheless, the number of actual working days stayed almost constant before 1900, despite that the number of working hours was falling. The number of working days varied between the industries. Agriculture had the most, whereas public administration had less than most other sectors.

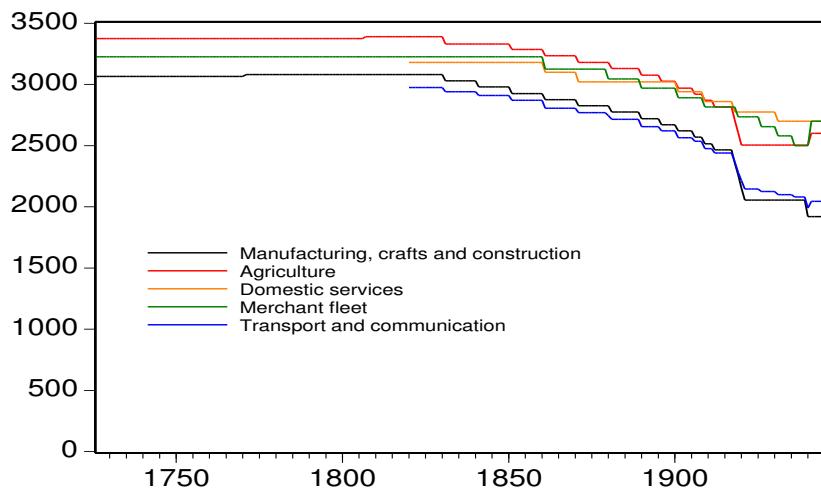

We have been able to find estimates of the number of working hours per man-year by dividing reported annual salaries by reported hourly wages. Again, the Wedervang Archive and Statistics Norway are our most important sources. One should note that time efficiency of work probably increased substantially during the nineteenth century. Thus, the formal working hours were significantly lower in the late nineteenth century than in the eighteenth century. However, the utilization of the working time was considerably higher in the nineteenth than the eighteenth century. It may be a valid assumption that the number of efficient working hours were at least as high in 1850 as in 1750. Nevertheless, this is not mirrored in the formal working hours, which we have to use here in order to arrive at representative annual wages. Figure 6.6 below reports the number of normal working hours assumed in this work. Note that these are not necessarily the working hours per actual man-year, but the working hours adopted here in order to transform our data into meaningful annual wage series.

For sailors we have monthly wages. They stayed on land substantial parts of the year. However,

³NOS 1965, 328–337.

⁴Bjerke 1966, 30–65.

FIGURE 6.1 Number of working hours per normal man-year used in present calculations, 1726–1945

Sources, Wedervang Archive, files W089 and W091, Minde 1993, 65–78 and Grytten 1994, 238–267.

the extra value of boarding has been estimated to about the same value as their free time on land. Thus, their monthly wages are multiplied with a factor of twelve to arrive at annual wages. For the period prior to 1798 boarding is included in the wages from the archive.

6.7 Wages by industry

By assembling data from various sources we have been able to map nominal wages back to 1726 for mining, manufacturing and crafts, 1751 for the merchant fleet, 1820 for agriculture, 1830 for domestic services, 1850 for communication and construction and 1875 for public services.

The major sources for the period up to the first decades of the nineteenth century are previous research on private records along with files from the Wedervang Archive. For the period stretching from 1820–1920 the Wedervang Archive is the basic source, whereas Statistics Norway takes over as the major provider of data thereafter.

6.7.1 Primary industries

We have been able to establish a dataset of wages for the primary industries back to 1899. For the sub-industries agriculture and forestry we have been able to trace the development back to 1820.

Historical wage data for hired labor on farms can be extracted from the Wedervang Archive, which keep records of farm accounts from 57 major Norwegian farms. Almost 50 of these can be

used as source for historical farm wages. Some of the data start as early as 1820, whereas the bulk of the records are taken from the mid nineteenth century onwards.⁵

The files report wages for both genders, though female wages are scarce until 1850. Both summer and winter seasons are included. Most observations are recorded as cash-wages for hired labor, exclusive of board and lodging. Thus, these have to be added. Ole Gjølberg and Torill Lønningdal have compiled substantial parts of the available data from the archive from the mid 1800s.⁶

In public records published by Statistics Norway, we find observations of daily wages for agricultural workers for every fifth year, starting in 1850 for men and in 1875 for women.⁷ The records report wages both in the summer and in the winter season. The five-annual series from Statistics Norway can be complemented with annual figures found in the Wedervang Archive to obtain an indicator of annual developments. The public records continue till 1915, when they are substituted with annual and more detailed wage series published by Statistics Norway.⁸ The latter series have good coverage of both farm and forestry wages. They also reflect seasonal differences, reporting spring, summer, autumn, and winter wages.

As for the period previous to 1850, most wage data do not include food provided for the workers by the farms. Thus, it has to be added to the cash wages. After 1850 the picture is mixed. Full cash payments were more common from the last decades of the nineteenth and the dawn of the twentieth century. Nevertheless, still as many as about half of all agricultural workers were compensated in non-cash wages until the post World War II era.

Both the Wedervang staff, Lønningdal and Gjølberg tried to map the value of non-cash payments.⁹ They all concluded that boarding and lodging was by far the most important factor of income for hired labor in agriculture in the nineteenth century. A problem with most of these estimates is that they add a more or less fixed share of compensation to the cash wages. Here, we try to examine annual values of compensation independently of cash wages.

We estimate food provided on farms according to a normal consumption basket for working class families, which is the closest we can get to farm labor in the existing consumption surveys for the period.¹⁰ Instead of adding a constant factor for food and lodging, we have taken estimates of consumption in three base years, 1850, 1880 and 1910. Thereafter, we have calculated annual consumption by interpolation with CPI as indicator of the fluctuations.¹¹ This operation provides us with more reliable series of non-cash wages in agriculture than hitherto.¹²

For the period from 1940–1945 we use wages in agriculture as reported by Statistics Norway in their historical survey of 1948.¹³ Thereafter we use quotations of wages in agriculture, forestry

and fisheries drawn from the national accounts' department at Statistics Norway. These are given in nominal figures for 2005 and thereafter calculated for every year 1946–2006 on the basis of reported annual changes in nominal wages for the different industries within the primary sector.¹⁴ It should be noted that Statistics Norway recommends the data on agriculture to be used with caution.

FIGURE 6.2 Annual wages in primary industries, in NOK, per man-year, 1726–2006. Semi-logarithmic scale.

6.7.2 Secondary industries

The available sources enable us to construct consistent series of wages for secondary industries as far back as 1726. We have been able to trace the development of the construction industry, the manufacturing and mining industry with its two sub-industries, engineering and textile, and finally, crafts.

Construction

The main source of information on wages within construction work is again the Wedervang Archive 1850–1920 and thereafter Statistics Norway. On the basis of these sources we are able to follow five different occupations over some time. These are road construction, railway construction, bricklayers, telecommunication and harbor construction and maintenance.

The road construction data cover construction and maintenance work on public roads financed by local or central governments. The series have been calculated by dividing wage costs by the total

¹⁴Data provided by Tor Skoglund, Statistics Norway 2007.

number of working days. They reflect more than 13.4 million estimated observations of daily wages for piecework from 1850 till about 1920. The corresponding number for workers on fixed salaries was almost 1.1 million. The data are reported practically from the entire country.¹⁵ The reported data make up continuous series for summer and winter wages over the entire period.

From 1915 onwards, we also draw our series from Statistics Norway, which from 1921 becomes the major source for our data.¹⁶ The data from the bureau also include both fixed and piecework salaries in public road construction all over the country.

The second most important group of wage data in the construction industry stems from public railway construction. The main source up to the interwar period is again the Wedervang Archive.¹⁷ The data starts in 1873 and continue till 1940, except for a lacuna 1884–1891. For the last 20–25 years the data from the Wedervang Archive are supplemented by records from Statistics Norway.¹⁸ On the basis of the archival data it has also been possible to give rough estimates on railway construction data back to 1854. The data are partly reported as daily and partly as hourly wages. We use daily wages here. Thus, we have to transform hourly wages into daily wages. Till 1913 it was common with ten working hours per day. In 1914 the normal was nine to ten hours per day, between 1915–1917 nine hours, and finally eight hours from 1918.

The records in the Wedervang Archive rest on 11.6 million and 1.7 million observations of piecework and fixed daily wages respectively. Hence, the number of indirect observations of hourly wages reflected in the archive is astonishingly 139.3 million and 22.8 million respectively.¹⁹

For the interwar period we also include bricklayers, port construction and maintenance workers and telegraph construction and maintenance workers into our series. These data were recorded and published annually by Statistics Norway with coverage for up to 40 main Norwegian urban areas. They are taken at different months of the year. Hence, the coverage must be considered good. These series were collected and reported partly as hourly and partly as daily wages. We have transformed all into daily, and thereafter to annual wages.²⁰

As for 1940–1945, we again find our data in Statistic Norway's historical survey of 1948.²¹ Thereafter, we use the office's accounts of yearly changes in annual wages in construction up to 2006.²² 2005 is used as the reference year, and the time series of annual changes is linked to this reference year in order to come up with annual series of wages in construction 1945–2006. Finally, all series are linked into a complete series of annual wages in the construction industry 1726–2006.

²²Data provided by Tor Skoglund, Statistics Norway 2007.

Manufacturing and mining

Wage data on manufacturing and mining are compiled from various sources. They have to be modified in order to arrive at consistent time series. Our source for the period 1726–1806 is Ingeborg Fløystad's work on working conditions, including wages, at the iron manufacturing plant Baasland and Næs Jernverk, outside Arendal.²³ Fløystad gives wages for manufacturing and crafts five-annually, starting in 1726 and ending in 1806, cash, boarding and lodging included. They are reported in riksdaler, ort and skilling. A problem connected to her data is different currency units. Formally they were all called daler. However, there were different versions of them, and they tended to depreciate. Here, we prefer the unit closest to the par silver value and splice the series in overlapping years according to official exchange rates.²⁴

A second source is the work by Matti Goksøy on working conditions at the Alvøen industrial plant outside Bergen. The company was founded in 1797 and was a pioneer in paper production based on hydraulic power.²⁵ Here we use wage data covering the period from 1820 till 1865 combined with records from the Wedervang Archive. The employees had individual contracts, where wage conditions for them and their families were set. The contracts spanned over a number of years, so that wages stayed fairly constant within intervals. Wage levels were thus consequences of when the contracts were signed, the size of the families and the number of working hands in the households. Boarding and lodging have to be added to the cash wages. Surveys from the mid 1800s provide us with information on the size of these non-cash payments. We arrive at about 60 per cent in 1850 and 70 per cent in the early 1820s. By using the CPI for Norway as indicator of the price movements in order to interpolate non-cash wages, we arrive at the total annual wages between 1820–1865.²⁶

From the 1820s the Wedervang Archive gradually takes over as the key source of Norwegian manufacturing wages. In the 1830s and 1840s the data found in the archive are dominated by huge industrial conglomerates within mining, wood and paper industry.²⁷ From the late 1840s textiles and mechanical industry take over the dominant position.²⁸ Women are included in the material for most years. For some series we have to add boarding and lodging. From the 1870s the archive reports annual data on the basis of some thousand observations of hourly, daily, weekly monthly and annual wages.²⁹ The most common unit is daily wages. The number of observations is increasing until 1920, thereafter falling.

Statistics Norway becomes our main source for manufacturing wages prior to 1920, as the bureau recorded data from almost 50 towns and industrial communities.³⁰ Admittedly, small-scale and new industries along with unorganized workers are under-represented in the files. Nevertheless, covering

³⁰NOS 1918–1941.

the bulk of the manufacturing labor force, they represent both valid and reliable aggregated series for the last decades prior to World War II.³¹

In addition to the records by Statistics Norway, Erling Petersen offers wages for mechanical engineering industry 1910–1940.³² Christian Venneslan of the Norwegian School of Economics and Business Administration is about to publish a new and rich dataset on manufacturing wages 1896–1939 as part of his PhD-dissertation. These cover the manufacturing industry better than any established series hitherto.³³

Finally we use data from Statistics Norway for the period from 1940 to present times. Again, the data covering the war years are taken from the historical survey of 1948, whereas annual wages 1946–2006 are compiled from records sent us by the national accounts' department at Statistics Norway.³⁴ Originally these cover 14 sub-industries of manufacturing. However, we are only able to follow two of these consistently well back into the nineteenth century, i.e. textiles and engineering.

Crafts

Ingeborg Fløystad gives five-annual wage series for craftsmen in iron production 1726–1806.³⁵ She includes boarding and lodging in her series. These series are reported as wages per year. From 1820 the Wedervang Archive serves as our main source. We first use wage data for senior blue-collar workers at the Kongsberg Sølvverk up to 1850. These have been extracted from financial records. Boarding and lodging have been added here according to the same principles as for manufacturing workers. From 1833 we also compile wages from the Wedervang files recorded from the Cappelen-Ulefoss industrial plant.³⁶

From 1875 the data have a significantly better coverage, reporting daily wages for painters, masons, carpenters, bakers, tailors, shoe makers in urban areas of Norway. From 1915 they include thousands of observations of eleven occupations. Data are given for both urban and rural labor nation-wide, despite a clear Oslo bias.³⁷ A problem with the data from Oslo is that in the second half of the 1890s they report piecework only, and they also give priority to tariff *ex ante* wages as opposed to *ex post* wages. However, information from the Wedervang Archive gives us the opportunity to adjust for these pitfalls. Female workers were basically excluded from the Wedervang records for crafts. Nevertheless, few women did work as craftsmen before the post World War II-period.

After 1915 Statistics Norway takes over as our most important source. They also report an aggregated series of daily wages for skilled artisans in 1914 and 1918–1940.³⁸ From 1940 onwards, Statistics Norway constitutes our only source. Daily wages for crafts are used up to 1946.³⁹ Thereafter we use persistent series of changes in annual salaries up till 2006.⁴⁰

6.7.3 Transport and communication industries

This group of industries stretches back to 1751 for maritime transports. It increases its coverage with domestic transport from the mid nineteenth century and then includes most types of private and public transport and communication from 1946 onwards.

Merchant fleet

We use data from the Wedervang Archive on sailors' wages dating back to 1751. These continue till 1921. Then, we use data from Frode Akstun till 1940 and Statistics Norway till present. The series from the Wedervang Archive are based on all capacities of crew listed at all ports where records were taken, i.e. up to 26 capacities in up to 26 ports. For the years before 1844 we have data from sailing

³⁸NOS 1915–1941 and NOS 1949, 364–365.

³⁹NOS 1949, 364–365.

⁴⁰Data provided by Tor Skoglund, Statistics Norway 2007.

vessels only, since steamers were not permanently introduced to the Norwegian ocean going merchant fleet at that time.⁴¹ From 1844 till 1921 we have data from sailing and steam vessels. Diesel motor ships are added when they first came into use in the early 1900s.⁴² From 1920/1921 we basically have data for steam and motorised ships, and for the post World War II-period chiefly motorised vessels. In the records seamen's wages are basically measured without boarding and lodging until the last decades.⁴³

The data culled from the Wedervang Archive was collected from basically three types of sources, i.e., recruitment lists, crew lists and dischargement lists, of which the first category is the one mostly used by us.⁴⁴ Note that this information is given only on crew joining in Norwegian ports on Norwegian ocean going vessels. Domestic ocean transport is excluded from the data. The empirical basis of the series is quite strong from the early 1800s, and particularly from 1816 onwards.

For the interwar period we use data from Akstun and Statistics Norway. These were originally taken from crew lists kept and reported by the ship owner's association.⁴⁵ The number of capacities of crew in these data is down to nine, and they basically account for steam and motor engine vessels. For the World War II-period we draw information from Lars Chr. Jenssen's work on working conditions for sailors on vessels belonging to the Norwegian state controlled ship owner company, Nortraship.⁴⁶ For the post-war period we use records from Statistics Norway only.

Domestic transport

Our data start in 1850 and are compiled from The Wedervang Archive. An important group of labor for the first decades is public road construction workers providing their own horses. The number of daily observations taken from all over the country varied between 225 in 1851 and 29,685 in 1896.⁴⁷ The data also include hire for horses. In the 1850s workers with horse were paid about twice as much as those without. In the 1890s the compensation for bringing a horse fluctuated around 29–36 per cent, and finally fell to 22 per cent in 1914.⁴⁸ For the period 1854–1910 the Wedervang Archive also provides records of daily wages from railways. These were taken from the railway workers union.⁴⁹

From 1915 we use data from Statistics Norway for this sector. These include transport in forestry by workers providing their own horse.⁵⁰ From 1920 onwards, Statistics Norway also give general wage data for drivers. This set of data includes both horse and motor drivers. Hence, they reflect an important part of passenger and goods transport nation wide.

⁵⁰NOS 1949, 367.

From 1940 till 2006 we use data from Statistics Norway only. For the war years 1940–1945 only rough estimates are available, but from 1946 more reliable wage series have been constructed on the basis of data reported to Statistics Norway in order to construct representative wage series for the national accounts.⁵¹ These basically report changes in annual wages. However, the levels are given for several years. Again we use the 2005 level and splice the series with this observation. Hence, we obtain continuous series till 2006.

Communications

The historical frontiers between the transport and communication industry and the construction industry are not always clear. E.g. should nineteenth century railway and telegraph maintenance be considered construction or transports and communications? The sources do not always leave us with clear indications. The term railway worker may include conductors, cleaners, maintenance workers, construction workers and railway station staff. Since we do not have sufficient information to classify this group according to their actual profession, it seems natural to classify them as part of the transport and communication industry, as we do here. These data start in 1850 and increase their coverage significantly in the 1870s.⁵²

From 1918 Statistics Norway also report hourly wages for telegraph workers, and from 1921 daily wages paid by port authorities. Data are given for both fixed wages and piecework.⁵³ Statistics Norway serves as our only source from 1940 onwards. For the first five years of this period we trace data from different sources published by the bureau.⁵⁴ Finally, we use the wage data set from the national accounts department from 1946 onwards.⁵⁵

6.7.4 Private services

When it comes to private services the sources are fairly scarce up to the twentieth century. However, there is basically one exception, private domestic services, and within this group chiefly housekeeping. A problem connected to this sub-industry is that domestic services were basically low paid jobs, whereas other private services, e.g. finance and consulting, were well-paid occupations. Private series as an aggregate is found by splicing Statistics Norway's data on annual wages in the private sector 1946–2006 with other series of private services 1915–1940 and private domestic services 1830–1915. Transport and communication is also used as an inter- and extrapolator for the development of wages in private services.

Domestic services

The Wedervang Archive serves as the most important source for domestic services. Our aggregated series start in 1830. We use data on wages for female domestic servants on major Norwegian farms.⁵⁶ On the basis of Gjølberg's work on farm wages we are able to construct estimates of annual wages for male domestic servants from 1850 onwards.⁵⁷ We also use Lønningdal's aggregated annual series of wages for domestic female servants on major farms in eastern Norway 1850–1910.⁵⁸ From about 1850 till their conclusion in 1920 the records in the Wedervang Archive improve significantly. In addition, five-annual data on wages for domestic male and female servants are drawn from records held by Statistics Norway.⁵⁹ The data from the Wedervang Archive and Statistics Norway are closely correlated both in levels and in movements.

In order to arrive at annual data of wages for domestic services in the urban eras before 1915, we have interpolated the five-annual urban data with annual rural data. For rural male labor we have interpolated between the five-annual observations 1850–1875 with the help of data left by Gjølberg

⁵⁹NOS 1949, 366–367.

along with corresponding female series by Lønningdal.⁶⁰

According to the records, cash-wages stayed fairly stable during intervals. Admittedly, boarding and lodging were stable in volume. However, their values fluctuated with price movements. Lønningdal proposed fixed sums to be added as non-cash wages. These are given for intervals.⁶¹ By examining the composition of consumption expenditures from the nineteenth century, we find that Lønningdal must have over-estimated their value.⁶² Using estimates of households' budget shares on food in selected base years, we calculate an appropriate sum to be added to the cash wages in these years. The annual values of non-cash payments is then interpolated between the base years according to prices on food and housing in the consumer price index for the period. By adding this estimated value of non-cash compensation to the cash wages, we arrive at annual series of nominal daily payments for domestic servants 1830–1940.

From 1915 Statistics Norway provides wage data for domestic servants, and from 1918 also for cleaning and laundry personnel.⁶³ There is some confusion about boarding and lodging in these latter series. By crosschecking the data, we notice that, contrary to the claim from Statistics Norway, the series for rural domestic services do not include boarding and lodging. Also, according to consumption surveys, the values for compensational payments are far too high in other tables by the office.⁶⁴ By using cash-wages and adding estimated non-cash wages on the basis of consumption surveys and price developments, we obtain representative series of their full wages.⁶⁵

From 1940 onwards Statistics Norway is our major source for wages in domestic services. Again the historical survey of 1948 serves as our most important source between 1940–1945, whereas data from the national accounts' section of Statistics Norway is our main provider of wage data for domestic services from 1946 onwards.⁶⁶ By linking these annual series to the series covering previous years, we arrive at continuous nominal wage series spanning over 176 years from 1830 till 2006.

6.7.5 Public services

It is difficult to map wages in public services prior to 1945. The Wedervang Archive holds some sporadic data from the early nineteenth century, but these are not consistent with the series presented here.⁶⁷ Elisabeth Bjørsvik has studied salaries for public servants in her PhD-dissertation on the public sector's contribution to GDP 1830–1865. However, she does not give any consistent series of individual wages.⁶⁸

The best available source is Kjell Bjørn Minde's, study on the profitability of higher education 1885–1960, which offers annual tariff salaries for public servants.⁶⁹ By diving into the works of Minde and his sources, we have been able to come up with representative estimates of *ex post* wages for public services. Admittedly, these do not have the same sound empirical basis as other series in this chapter. Nevertheless, they serve as a valid indicator for the development of wages in the public sector till 1940. Thereafter we use data published by Statistics Norway on annual wages in public services.⁷⁰

Public administration

Minde primarily pays attention to public administration and education. He offers wage data on public servants in the central and local public administration. Most of his data report wages of senior bureaucrats. Thus, they are higher than the average. However, he also gives wages for technical personnel and assistants and more junior secretaries. By adding extra payments to the tariffs and constructing a normal distribution of employees according to the tariffs, we arrive at reliable estimates of public administration wages, inclusive central ministries up to 1946.⁷¹

⁶⁹Minde 1993, 25–123* (appendix).

⁷⁰Data kindly provided by Tor Skoglund, Statistics Norway 2007.

⁷¹Minde 1993, 25–123* (appendix).

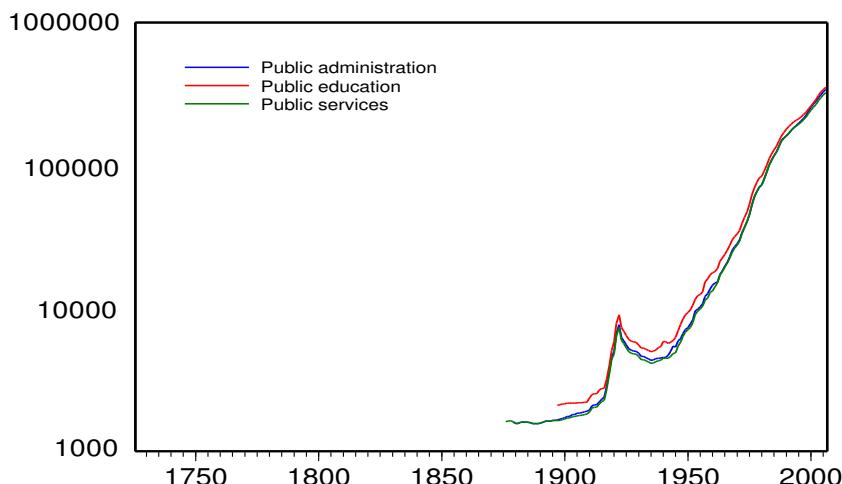

For the period after 1946 we use data provided by Statistics Norway.⁷² We have gained access to unpublished files and have been able to construct one combined series of annual wages in public administration. This is spliced to the pre-World War II series, and thus we arrive at annual wages for public administration from the late nineteenth century till present.

Public education

Minde also reports wages of teachers, lecturers, assistant professors and professors from the late nineteenth century till 1960. Again, these are tariff wages. However, by diving deeper into his material, including estimated *ex post* wage determinants, we find actual salaries.⁷³ Admittedly, Minde's series are biased in that they basically cover senior staff, but by linking them to Statistics Norway's data on the level of over-all salaries in education in 1946, we arrive at representative numbers for the years prior to World War II.

The data from Statistics Norway represent the total educational sector of Norway, and provide annual wages from 1946 till 2006.⁷⁴ By splicing the post- and pre-World War II-series, we conclude with a joint series wages for public education in Norway from the 1890s till 2006.

6.7.6 Total

By summing up the 18 series, we arrive at average wages for the total Norwegian labor force for the 280 years spanning from 1726 till 2006. In order to do so, we have to give all series by industry and sub-industry weights. And, in order to make that happen, we have to come up with the same unit of account, which is kroner per man-year.

Behind Figure 6.7.6 we know there are significant wage differences between industries (see appendix). In particular, public services were comparatively well off until World War II. Thereafter, we find a rapid convergence and simultaneous development up till present days. For the years prior to 1911, we find a tendency towards somewhat lower nominal wages in the secondary sector than believed hitherto. This is, however, due to the fact that our new series have better coverage than previous figures.

6.8 Conclusions

As part of Norges Bank's project on Historical Monetary Statistics this chapter offers 18 series of nominal wages classified by industry back to 1726. We have also presented an aggregated series for total average annual wages in Norway between 1726–2006. The data are collected and compiled from various sources. The most important ones are previous work done by other scholars on the basis of private and public archives, the Professor Dr. Ingvar B. Wedervang's Historical Archive on Wages and Prices, located at the Norwegian School of Economics and Business Administration, and records held by Statistics Norway.

In order to make the series comparable, they are calculated into man-years and annual wages. We then arrive at annual nominal wages 1726–2006. The results reveal that nominal wages in the long run stayed fairly stable both in the eighteenth and nineteenth century, before they started to grow on a more permanent basis in the twentieth century, in particular during the post-World War II period. Our results also reveal that a convergence of wages between industries took place. In particular, public services lost ground as a high wage industry during the twentieth century.

In Chapter 7 we provide estimates of real wages between 1726–2006 by deflating the time series of total annual wages with the consumer price index presented Chapter 3 of the first volume of Historical Monetary Statistics of Norway.⁷⁵

CHAPTER 7

Historical Monetary Statistics for Norway - some cross checks of the new data

Øyvind Eitrheim, Ola H. Grytten and Jan T. Klovland¹

This chapter provides an overview over the new historical data in this volume. We discuss some of their macro implications for implied revisions of money and credit aggregates and the long run development of short term and long term real interest rates and aggregated real wages.

¹Øyvind Eitrheim is director of the Research Department in Norges Bank, Ola H. Grytten and Jan T. Klovland are professors at the Department of Economics, Norwegian School of Economics and Business Administration, and special advisers to the Research Department, Norges Bank.

7.1 Introduction

During the course of work with the Historical Monetary Statistics project the main focus has been on documenting the validity and reliability of the historical data which are collected and systematized. Most of the preceding chapters of the two volumes has focused solely on the construction of data of a particular type, like e.g. the *consumer price index* in Grytten (2004a, Chapter 3) or *bond yields* in Klovland (2004a, Chapter 4) of the first volume of Historical Monetary Statistics for Norway. Similarly, Klovland's work on the balance sheet of *savings banks* in Chapter 2 and *commercial banks* in Chapter 3 of the present volume, or Grytten's work on daily, monthly or annual *wages by occupation* in Chapter 5 or annual *wages by industry* in Chapter 6 are also examples where data of a particular type are discussed in isolation. Throughout the work we have resisted the temptation to start analyzing the data beyond what we believe has been necessary to provide documentation on how the data have been constructed. We will use this final chapter to provide some simple cross checks on the validity and reliability of the data presented. For this purpose we will combine historical information from different chapters of the two volumes of Historical Monetary Statistics and construct new variables which can be of help for the evaluation.

We offer cross checks in three areas. First, we combine the long term bond yields presented in Klovland (2004a, Chapter 4) with the short term interest rates presented in Chapter 1 of this volume. In addition we calculate *long term real bond yields* and *short term real interest rates* using a smoothed inflation rate as a proxy for inflation expectations, drawing on the historical consumer price data presented in Grytten (2004a, Chapter 3). The data for aggregate bank deposits and bank loans which can be derived from the historical data on the balance sheets of individual savings banks and commercial banks in Chapters 2 and 3 can be compared with previous estimates in Klovland (2004b, Chapter 5) and Eitrheim et al (2004, Chapter 10). We investigate the absolute and relative size of the revisions of these estimates and compare them with the nominal GDP-series presented in Grytten (2004b, Chapter 6). Finally we present estimates of *real annual wages* by deflating the estimates of historical annual wages presented in Chapter 6 of this volume with the consumer price index presented in Grytten (2004a, Chapter 3), and we also compare the real wage data with the real GDP per capita series presented in Grytten (2004b, Chapter 6).

7.2 Long term and short term interest rates 1818–2007

Figure 7.1 plots the long term nominal yields on government bonds against the short term nominal interest rate on marginal Central Bank liquidity and nominal interest rates on bank deposits and bank loans from 1818 to 2007. The interest rate on marginal Central Bank liquidity is set equal to the Norges Bank discount rate before 1965, thereafter it is constructed from the rates on various liquidity instruments. See Chapter 1 for details.

Firstly, we note that the marginal liquidity rate is always higher than the reported rate on bank deposits which indicates that banks have to pay a positive premium on Central Bank liquidity above

the compensation offered to depositors.

Secondly, we find that the reported deposit rate seems to move quite closely with the marginal liquidity rate over this period although, as we see from inspecting the 1970s and 1980s, with considerable lag during some sub-periods.

Thirdly, the marginal liquidity rate seems to be considerably more volatile than the bond yield throughout the entire period and also more volatile than the bank interest rates from the mid 1960s. The marginal liquidity rate and the short term money market rates gradually converge during the latter half of 20th century. This may be due to the fact that the money market becomes more developed, but it may also reflect the fact that monetary policy becomes more market oriented.

FIGURE 7.1 Long term and short term nominal interest rates, 1818–2007. The nominal bond yield is plotted against the nominal interest rate on marginal CB-liquidity and nominal interest rates on bank deposits and bank loans.

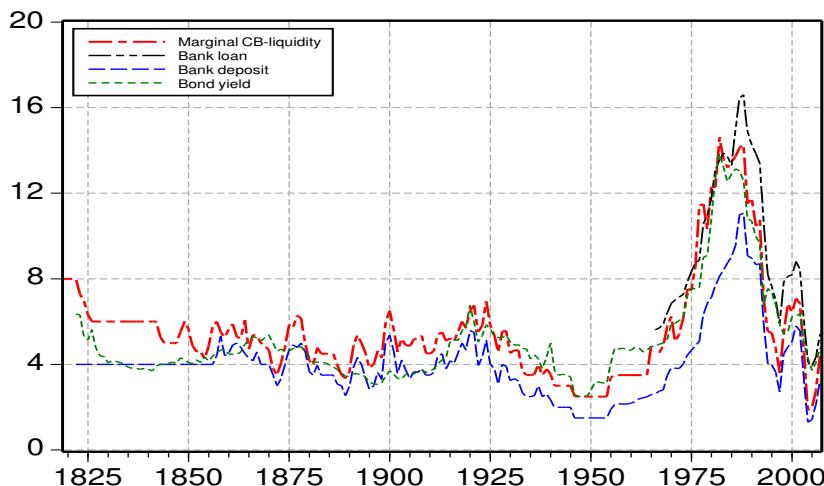

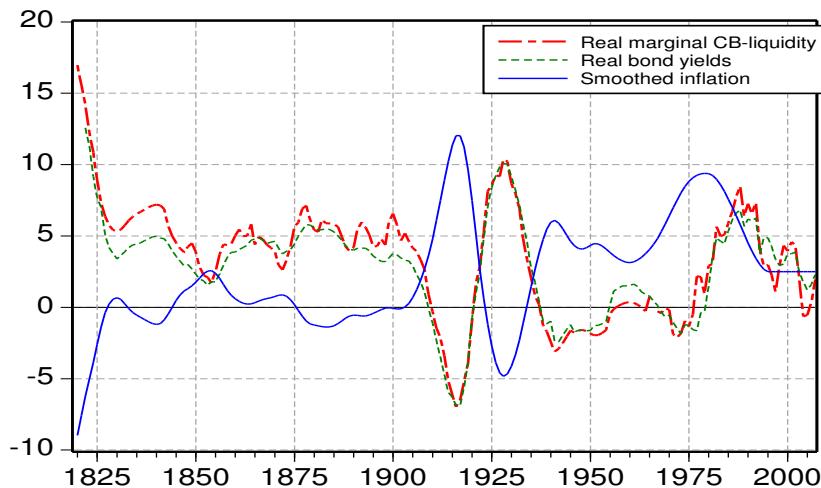

Figure 7.2 plots the real yield on long term government bonds, the real short term marginal liquidity rate and a smoothed measure of inflation as a proxy for low frequency changes in inflation expectations. Admittedly, this is a crude and mechanical approach to represent real interest rates. However, it may serve as a simple first attempt to cross check the historical interest rate data. From 1995 the calibrated measure of inflation expectations is set equal to the current inflation target 2.5 per cent.

FIGURE 7.2 Long term and short term real interest rates, 1818–2007. The real bond yield is plotted against the real interest rate on marginal CB-liquidity.

We observe that whereas the real interest rates fluctuated around a relatively high level during the 19th century, they remained at historically low levels during the post-World War II until the late 1970s when inflation had already gained momentum and were approaching its peak level close to 10 per cent around 1980. Interestingly, there has been more volatility in the short term real interest rate based on the marginal liquidity rate over the last 15 years of the sample than in the case of the real yield on government bonds.²

7.3 Revised data on bank deposits, bank loans and aggregate money holdings 1822–1918

The new estimates of bank deposits and bank loans loans in the savings banks and commercial banks presented in Chapters 2 and 3 above imply some revisions to the estimates of aggregate money holdings presented in Klovland (2004b, Chapter 5/Volumne I). Table 7.C.1 in the appendix contains the new time series of aggregate savings bank and commercial bank deposits for all years through 1918. More details on the construction of these data can be found in Chapter 2 in the case of savings banks and in Chapter 3 concerning commercial banks.

The currency component is not revised, but the new estimates of bank deposits differ somewhat

²We have used the same measure of inflation expectations in the calculations of the long term and short term real interest rates. Other assumptions based on a more volatile measure of short term inflation expectations might have yielded even more volatile short term real interest rates compared with the long term real interest rate.

from the previous ones, particularly in the case of commercial banks, which were partly based on the estimates in Matre(1992) before 1900. Some of the increase in the amount of deposits in the latter half of the 1870s and early 1880s found in the old data is shifted forward to the period 1870-1873 in the new series. In addition, there is a sharper decline in the years 1875 and 1877. In both cases the revised data reinforce the positive correlation between money and nominal income. The early 1870s were peak years of economic activity in Norway³, nominal GDP expanded at an annual rate of 11.5 per cent between 1870 and 1873. Conversely, both 1875 and 1877 registered a fall in the money stock and in nominal GDP.

FIGURE 7.3 New and old money aggregates, 1819–1918. End-of-month observations of broad money M2

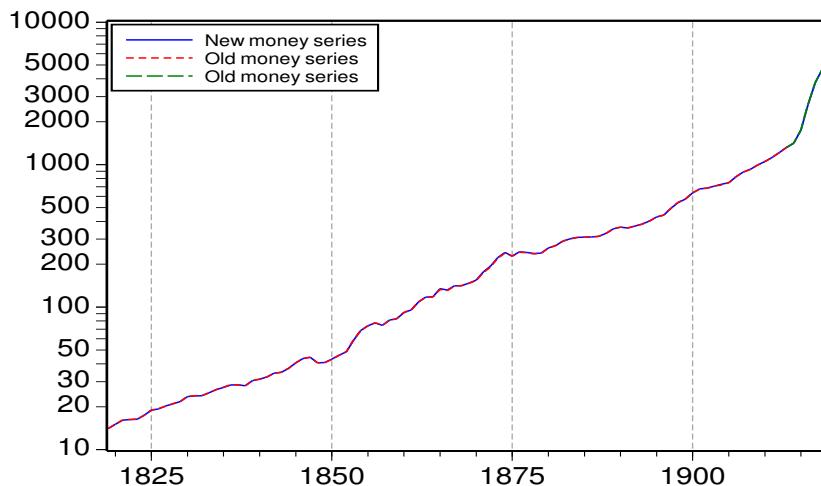

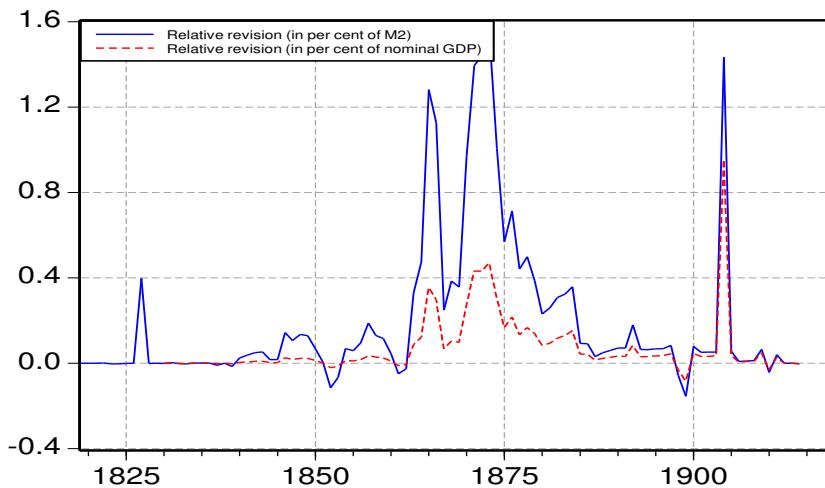

Figure 7.3 shows the old and new estimates of aggregate money holdings from 1819 to 1918. It is hard to distinguish the two series based on eye-balling the graph. We have calculated the relative size of the revisions measured in per cent of the old estimates as well as in per cent of nominal GDP. Figure 7.4 shows that the largest revisions are recorded in the early 1870s when the revisions amount to around 1.5 per cent of the previous money stock estimates and close to 0.5 per cent of nominal GDP. This is in accord with the explanation given above.

Time series of bank loans from commercial and savings banks were presented in Eitrheim et al. (2004), but their data were incomplete prior to 1869, and were based on rather less satisfactory sources prior to 1900. Collecting the estimates of chapters 2 and 3 we are now able to present a revised and complete series of bank loans from 1822 to 1918, which are found in Table 7.C.2. This table also summarizes the revised estimates of the number of savings banks and commercial banks.

³See Klovland (1989) for an account of Norwegian business cycles in this period.

FIGURE 7.4 Revisions of money aggregates, 1819–1918. In per cent of old estimates and nominal GDP

The new estimates of commercial and savings banks' loans thus provide us with a complete annual record of bank loans in Norway beginning with the establishment of the first savings bank in 1822. These data can be linked to the time series of commercial and savings bank lending after 1918 in Table A2 of Eitrheim et al. (2004) to form a continuous time series of bank loans extending over nearly two centuries.

Figure 7.5 shows the old and new estimates of bank loans from 1822 to 1918. Firstly, we note that the estimated amount of credit from 1840 to 1875 seems to be quite close to the previous estimates which were only available for every fifth year in this period. When we make a closer look at the size of revisions they turn out to be sizable relative to the amount of credit due to the rapid expansion of the banking sector in this period, cf. Figure 7.6. Bank credit revisions gradually increase to a level around 3 per cent during the period 1875–1880 when measured relative to nominal GDP. Revisions of bank credit also picks up temporarily around the turn of the century.

FIGURE 7.5 New and old data on aggregate bank loans, 1822–1918. End-of-month observations of total bank loans

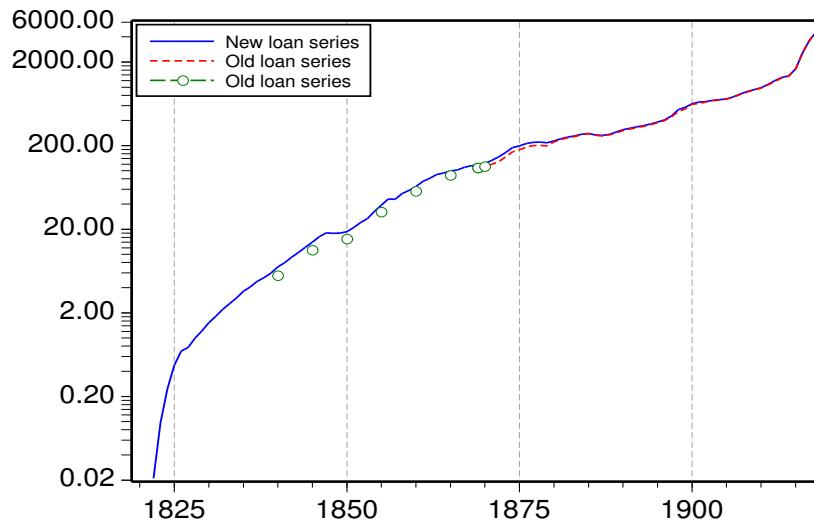

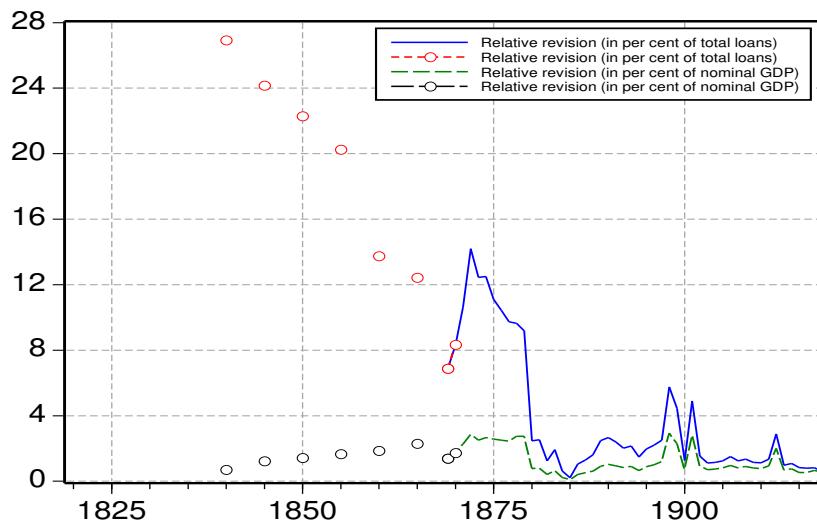

FIGURE 7.6 Revisions of data on aggregate bank loans, 1822–1918. In per cent of old estimates and nominal GDP

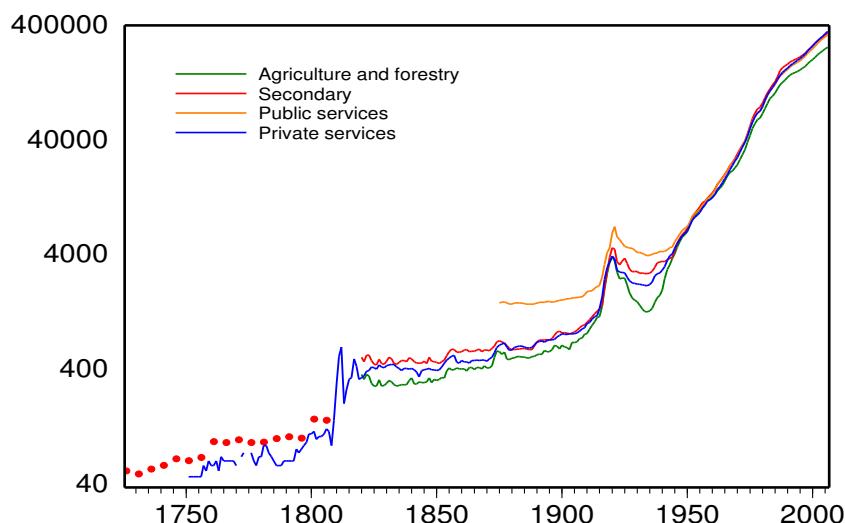

Total lending from private banks is an important indicator of credit market activity, but falls short of covering the whole loan market. A broader credit aggregate before 1900 would also have to comprise the loans provided by (1) Norges Bank, (2) Kongeriket Norges Hypotekbank, (3) the Loan and Discount Commissions and various Public Funds established by the central government, as well as (4) insurance companies.⁴ From *Amtmannsberetninger 1861–1865 (C no. 2)*, p. XLVI, an estimate of first three items for 1865 is available. In millions of kroner these were: (1) Norges Bank 33.6 (2) Kongeriket Norges Hypotekbank 30.1 (3) central government sources 41.7, which can be contrasted with loans from savings banks of 68.2 millions NOK and, from commercial banks, 31.2 millions.

Although bank loans thus may have constituted somewhat less than fifty per cent of the total credit supply in this period, it is likely that this component would account for the greater part of the annual fluctuations in a wider credit aggregate.

7.4 Nominal wages 1726–2006

By weighting the nominal wages by industry with their share of total employment and linking this share to their corresponding wages we then arrive at different aggregates of wage series for the entire period 1726–2006. Some key series of annual wages are presented in Figure 7.7.

FIGURE 7.7 Annual nominal wages in key industries in NOK, 1726–2006. Semi-logarithmic scale

⁴Time series of the first two items are readily available, but finding annual figures for the various central government sources and for insurance companies would meet with problems. From 1899 the data in Skånland (1967) are useful for this purpose.

For the period 1946–2006 these are almost identical to the most recent series from Statistics Norway. For the period 1935–1939 they are also almost identical to other indices calculated at Statistics Norway. For the period 1911–1934 they satisfactorily match tax records from the Inland Revenue.⁵ As for the years prior to 1911, we find a tendency towards somewhat lower nominal wages in the secondary sector than believed hitherto. This, is however due to the fact that our new series have better coverage than previous figures.

Figure 7.7 reveals significant wage differences between industries and sectors. In particular public services were comparatively well off until the World War II. Thereafter, we find a rapid convergence and simultaneous development until present days.

7.5 Deflator

In order to construct real wage series we have to adjust our new nominal wage series for price changes. This procedure is conducted by deflating the nominal wage series by the consumer price index documented in Grytten (2004a, 47–98).

The consumer price index stretches back to 1516. From 1666 it offers annual observations on the consumer price movements till present days. During the 18th century both its validity and reliability increase. From 1819 it includes 29 product items in eight consumption groups. The numbers increase to 47 commodities representing nine consumption groups from 1830 and 55 items representing ten consumption groups from 1850, when the cost of living index (CLI) by Ramstad has been adopted.⁶ From 1901 the CLI index from the Kristiania Statistical Office was adopted and this index was spliced with the Social ministry's CLI during 1916–1919. Statistics Norway thereafter constructed their own CLI from 1919–1959. From then on it was replaced by Statistics Norway's official consumer price index (CPI).⁷

Like most historical CPIs and CLIs our deflator is constructed by a Laspeyres approach, meaning that we have fixed commodity weights during periods. The key sources of price data during the 18th century are accounts by merchants in one of the most important commercial cities in the Nordic countries at the time, i.e. Bergen. Though, some market prices are taken from other locations up and down the country, Bergen still serve as the most important source of price data until 1830. From then on price data collected almost all over the country by request from the central government serve as our most important source. In the 1930s these price data were assembled by the staff of the Wedervang Archive. The archive now serves as one of the richest sources of market prices on consumer goods in 19th century Europe. Both their validity and reliability seem very high. In the first place they do reflect market prices to consumers. Secondly, they were recorded by local civil servants monthly or at least quarterly on the basis of a strict regime set by the central authorities.

⁵Grytten 2000, 22–41.

⁶Ramstad 1982, 158–238.

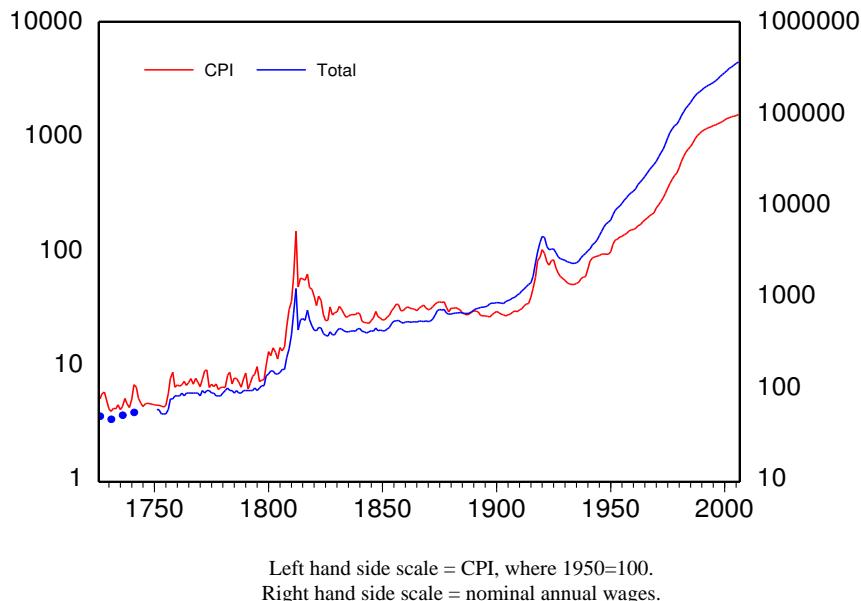

⁷Grytten 2005, 72.

Thirdly, the price quotations and the procedure of collecting the data were both controlled by civil servants in the central administration.⁸

The commodity weights in the consumer price index were decided on the basis of different consumption surveys conducted both for the 19th and the early 20th centuries.⁹ From 1871 the CPI rely solely on the established CLI by Ramstad, from 1901 on the adopted CLI by Statistics Norway, from 1919 on the bureaus own CLI, and finally from 1959 on their own CPI. This implies that the deflator adopted here seems reasonably reliable for the period 1726–1819, fairly reliable for the years 1819–1830 and quite reliable 1830–1919. Thereafter our deflator is very reliable, comprising price observations of up to around 700 items till 1959 and thereafter about a thousand or more items. In sum the latter index comprises 40.000 to 45.000 observations per month.

The consumer price index is plotted along with the annual series of nominal wages for the period 1726–2006 in Figure 7.8.

FIGURE 7.8 Development of CPI and total nominal wages, 1726–2006. Semi-logarithmic scale

We observe from Figure 7.8 that nominal wages and prices move in the same direction both in the short and in the long run. However, prices seem to fluctuate more than wages. This implies the existence of rigid nominal wages, as they were often set in fixed terms. We can also see that wages started to increase significantly faster than the price level from the 1820s, indicating increasing standard of living and economic growth.

⁸Grytten 2004b, 61–80.

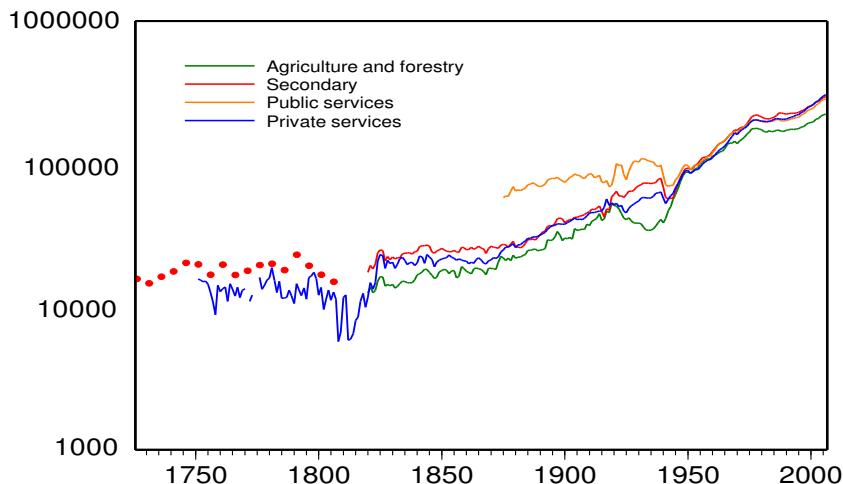

⁹Grytten 2004a, 63–66.

By assessing the different sub-indices we can conclude that the consumer price index reported in Grytten (2004a, 47–98) should serve as a suitable deflator in order to arrive at real wage series for Norway 1726–2006.

7.6 Real wages 1726–2006

Having arrived at new series of Norwegian annual salaries 1726–2006 and presented the new CPI, also constructed as part of the historical monetary statistics project, we are now in a position to conclude with real wage series. This is done by deflating the new nominal series by the mentioned CPI according to equation (4) and (5). In other words we deflate the constructed Paasche and Laspeyres wage series with a Laspeyres deflator. Again we present four series graphically, i.e. real wages for agriculture and forestry, the secondary sector, private services and public services. These are shown in Figure 7.9. For the other 14 series by industry and sub-industry, along with a series for total aggregates, see in the appendixes.

FIGURE 7.9 Real annual wages, 1726–2006, in fixed 2000-NOK. Semi-logarithmic scale

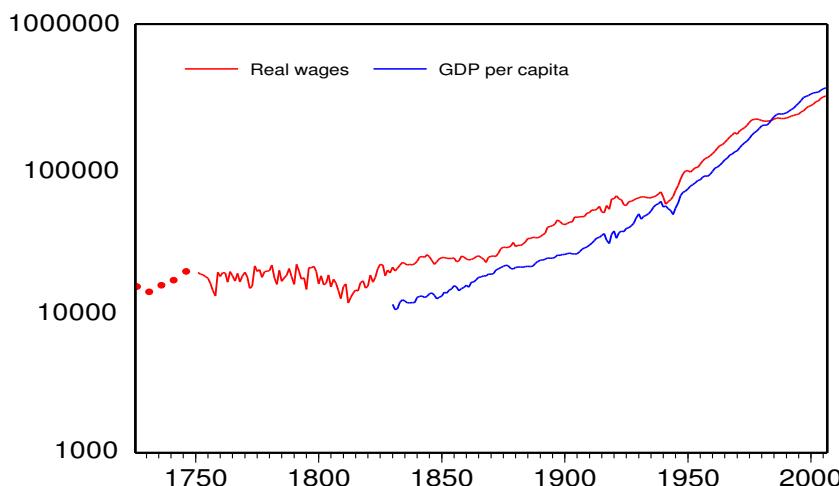

According to Figure 7.9 long-term real wages stayed fairly stable until the 1820s. However, in the short run there were huge fluctuations, mostly due to volatile prices. From the late nineteenth century we see firm evidence of increasing rates of real wage growth. During the 1870s, 1880s and the first half of the 1890s this was very much due to deflation. The growth of real wages between 1905 and 1916 can easily be seen as a consequence of rapid industrialization and economic growth. In the interwar period we see divergence between sectors and industries, with agriculture and forestry as the two dominant losers, due to excess production and severe deflation in product prices of primary

products. After World War II we find rapid and steady real wage growth in all sectors until the mid 1970s. Thereafter the rates of growth dive significantly and differences between sectors start to increase again, with agriculture as the loser. Finally, in the 1990s and till now we find a dramatic increase in real wages for most industries and sectors again.

In Figure 7.10 we compare the development of annual real wages per man-year and GDP per capita. The GDP figures 1830-1865 are taken from the current project and spliced with Statistics Norway's historical national accounts 1865 onwards.¹⁰ As the figure reveals, GDP per capita has grown significantly faster than real wages, revealing that private consumption has become a continuously smaller part of the expenditure side of the GDP. When real wages multiplied with a factor of 16.08 from 1830 till 2006, the per capita GDP volume multiplied with more than twice as much, 32.77. At the same time the private consumption level per capita according to the historical national accounts increased 17.33 times, in line with our measure of real wages.¹¹ The differences between the two can be explained by increasing tax and saving levels.

During the last years, however, real wages have grown faster than the GDP per capita in volume terms. At the same time the implicit GDP deflator has increased significantly faster than the consumer prices. This is also mirrored in a positive shock in Norway's terms of trade during the last years.

FIGURE 7.10 Real annual wages and GDP per capita, 1830-2006, in fixed 2000-NOK. Semi-logarithmic scale

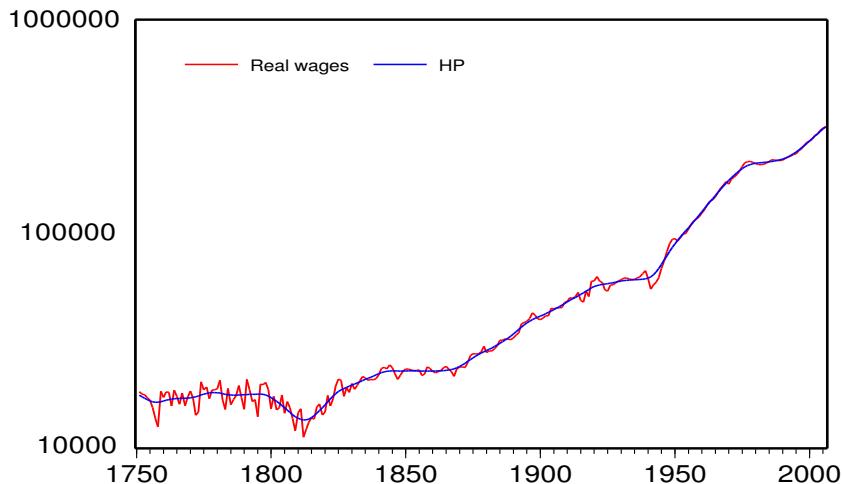

In summary, all our new real wage series in the long run seem to correspond well with volume figures from the historical national accounts. In the short run we do not expect the same degree of uniformity, which is also mirrored in the series.

¹⁰Grytten 2004c, 241-288, NOS 1965, 348-351 and

¹¹Grytten 2004c, 277-280.

FIGURE 7.11 Real wages and HP-trends, 1751–2006, in fixed 2000-NOK. Semi-logarithmic scale

We apply the HP-filter (with $\lambda=100$ on annual data) to separate the long-term trends of the series from the short-term cycles. This enables us to see the trend patterns in our series more easily, cf. Figure 7.11. Interestingly, the aggregated real wage level seems to have remained fairly stable during the 18th century. Thereafter the real wage showed a rapid downturn during the high inflation period from about 1800 to the end of the Napoleonic wars. This was followed by a period of increasing real wages during the long deflation period up till 1842. A deflationary monetary policy was pursued through the 1820s and 1830s in order to bring the new speciedaler back to its par silver value. Redemption to silver parity was reinstated in April 1842.¹²

Thereafter the long-term trend shows fairly stable real wages. However, there were still significant short-term fluctuations during the first industrial wave from the early 1840s until the mid 1870s. Real wages increased substantially during the second wave of industrialization and the international deflation in the 1870s and 1880s. This trend continued until the 1930s, when real wage growth almost ceased until the post World War II period. After this real wages increased considerably until the end of the 1970s, and again gained momentum during the years of lower inflation in the 1990s and early 2000s.

Finally, the annual growth rates of real wages in different industries are reported in Table 7.1. Average growth rates of real wages are calculated for different subperiods applying a first-to-last-year approach. Note that for the years 1945–2006 *total* wages show the highest growth rates. This is again due to the fact that the classification *total* is not the same as average, but also includes employees not reflected in the other industries mentioned here as well as independents. The restructuring of the

¹²Eitrheim and Qvigstad 2005, 1–17.

economy from old to new industries also influences this outcome.

As reported in Table 7.1 the annual growth of total real wages 1726-2006 is calculated to 1.11 per cent. In the long run transport and communication along with private services seem to have been the winners. Public services almost constantly lost ground to all other sectors. However, one has to bear in mind that public services started at a considerable higher level than all other sectors and industries. The decomposition of the public sector has changed substantially between 1870–2007. The employment share of e.g. senior public servants, who originally had relatively high wages, has declined, and at the same time their wages have also declined relative to the wages of other groups of employees in the public services sector.

It is also worth to notice that real wages were at the same level in 1820 as almost a hundred years earlier. This may indicate that the general wealth may have been about the same around 1820 as around 1720. This implies that any economic growth that may have taken place in the eighteenth century was fully reversed during the turbulent two first decades of the eighteenth century. According to Figure 7.11 real wages were reduced between 1751 and 1820. Certainly, they reached a peak in 1751 and were stabilized thereafter. However, the very peak of the eighteenth century was in 1791. The huge fall in real wages seems to have occurred from 1799.

From 1820 to 1940 real wages show a steady rate of growth. In particular, as we have seen, during 1820-1850 due to the recovery from the war-years in the early nineteenth century. Finally, the period after 1945 saw the most rapid growth rates of real wages. In addition, the rates were quite similar, however, with a wage converging tendency between industries.

TABLE 7.1
Growth rates of real wages by industry

	1 Agriculture and forestry	2 Secondary industries	3 Transport and communication	4 Private services	5 Public services	6 Total
